This publication describes a curriculum framework and is intended to be of practical help to teachers and administrators. It has been developed over a period of some years by the efforts of many people and, as with all PYP publications, the ideas are to be taken in the spirit in which they are offered—as suggestions from a peer group, faced with the same issues as the reader.

Making the PYP happen is an in-depth guide to all aspects of student learning; it is a guide to curriculum in the traditional sense of a written set of objectives ("What do we want students to learn?") but also to the theory and application of good classroom practice ("How best will they learn?"), including effective and appropriate assessment ("How will we know what they have learned?"). Since the PYP views curriculum as a transdisciplinary whole, these three main components of the curriculum cycle have been used as the primary organizers.

Within each section the generic implications of the main ideas are followed by a reflection of these ideas within the context of each discipline.

In translating the thinking represented in this guide into practice, it is important to use the included set of practical materials with which teachers plan their teaching and assessment, and evaluate their work. This is essential for successful implementation of the programme.

Making the PYP happen is also a response to practical questions raised by school leaders who are often obliged to respond to pressures from many, sometimes conflicting, sources. It seems likely that they might respond to some support themselves, in the form of the best advice that the PYP can offer—a concise, accessible overview of key points linked to practical ideas for action. The PYP recognizes the fact that improvements, and therefore changes, in the classroom only happen in the context of overall school improvement. Given the vital role of the school’s leadership in this process, it is clear that the implementation of the PYP curriculum framework will depend to a large extent on the support of the school’s leadership. These guidelines represent a combination of research and experience—ideas that have worked in other international schools.

The PYP trusts that this publication will serve its purpose and prove to be a useful resource as we work together to improve the quality of learning for students, teachers, parents and administrators in the international community of learners.
What are the beliefs and values that drive the PYP?

The PYP aims to synthesize the best research and practice from a range of national systems with the wealth of knowledge and experience in international schools to create a transdisciplinary curriculum which is relevant, challenging and engaging for learners in the 3–12 age range.

The driving force behind the PYP is a deeply held philosophy about the nature and future of international education, a philosophy which is expressed in the statements which follow. The first, the mission statement of the International Baccalaureate Organisation, expresses the IBO’s overall purpose as an organization. The second, Internationalism: the PYP perspective, sets out the PYP’s beliefs and values about internationalism as being defined by the nature of student learning in PYP schools. The PYP defines this learning through a student profile which encompasses the aims of the curriculum. The perspective goes on to identify elements in our schools which are worthy of our consideration as we strive to become ever more international. The third, Beliefs and values, from a language, a mathematics, a science and technology and a social studies perspective, forms the vehicle through which the student learning outcomes are explored.

The mission statement of the International Baccalaureate Organisation

Through comprehensive and balanced curricula coupled with challenging assessments, the International Baccalaureate Organisation aims to assist schools in their endeavours to develop the individual talents of young people and teach them to relate the experience of the classroom to the realities of the world outside. Beyond intellectual rigour and high academic standards, strong emphasis is placed on the ideals of international understanding and responsible citizenship, to the end that IB students may become critical and compassionate thinkers, lifelong learners and informed participants in local and world affairs, conscious of the shared humanity that binds all people together while respecting the variety of cultures and attitudes that makes for the richness of life.

Internationalism: the PYP perspective

The PYP believes that the attempt to define the ideal of internationalism in ever clearer terms and the struggle to move closer to that ideal are central to the mission of PYP schools.

Given the complexity and variety of PYP schools and the abstract nature of the concept itself it would be naive to propose any simple definition and expect it to stand up to rigorous examination. Rather, the PYP would suggest that any definition is likely to be compound, reflecting a range of interrelated factors. What these factors might be is suggested later in this perspective.

However, in examining these factors during the years since the inception of the PYP, one aspect of PYP schools emerges, not only as the most significant, but also as the common ground on which PYP schools stand, the essence of what they are about: this is the kind of student who we hope will graduate from PYP schools, the kind of person we would proudly call an internationalist.

The PYP is suggesting then, as central to its definition of an international education, the following student profile (figure 1). In so doing, the PYP is placing the focus of schools where it belongs, on student learning. The PYP is saying that schools should be proud to send out into the adult world students who exemplify the qualities expressed in this profile. The PYP is conscious that this profile is value-laden and, it would say,
quite rightly so, for this kind of learning is what the PYP values, it is what the PYP stands for and it is the embodiment of what international education is all about.

This profile is central to the work of the PYP. It represents its aims, it drives the curriculum framework which follows and it is central to the process of summative assessment which closes the circle of our work with students. It represents the qualities of internationalism which the PYP hopes will characterize its graduates, the contribution of PYP schools to this complex, challenging world.

What, then, is a PYP school? From the PYP’s perspective it is a school which, regardless of location, size or constitution, strives towards developing an international person. What is an international person? From the PYP’s perspective it is a person with the attributes and dispositions described in the student profile which has been identified.

Figure 1  PYP student profile

Clearly, success in achieving this profile will depend on more than just curriculum, even given the PYP’s inclusive definition of curriculum. It will depend on a multitude of factors (see page 5), each contributing to overall success, each driven by beliefs and values embodied in the profile.
How international is our school?
Factors for consideration:

The school’s culture
and the extent to which it:
accommodates, reflects and celebrates the cultures represented in the school.

The school’s climate
and the extent to which it:
offers a safe, secure, stimulating environment to all its learners.

The students
and the extent to which the school:
takes positive advantage of the diversity within the student body to enrich the learning and lives of the whole school community.

The example of adults
and the extent to which:
the adults in the community actively model the profile advocated for the students.

The curriculum
and the extent to which it:
reflects developments in curriculum research from a range of different national and international sources
focuses on key concepts, such as connection, perspective and responsibility
explores transdisciplinary themes which have been selected on the basis of their relevance and importance within a body of knowledge which has local and global significance
develops essential skills, such as the ability to conduct research, communicate effectively, function successfully in different social contexts, manage one’s health and life, think critically and creatively
fosters positive attitudes, such as tolerance, respect and responsibility
provides opportunities for meaningful action and social service.

The resources
and the extent to which they:
offer access to different cultures, perspectives and languages.

The staffing policy
and the extent to which it:
seeks and supports teachers from a representative range of nationalities and cultures.
The language policy
and the extent to which it:

- offers support in the medium of instruction and in the mother tongue of students
- provides the opportunity to learn further languages, notably the language of the host country
- provides for languages across the curriculum, in recognition of the fact that all teachers are language teachers
- is empathetic towards adults in the school’s community for whom the school’s medium of instruction in not their mother tongue.

The special needs policy
and the extent to which it:

gives access to an international education to all students.

A commitment to reflection
and the extent to which the school:

- looks inward, reflecting constantly and honestly on its policies and practices.

A commitment to extension
and the extent to which the school:

- looks outward, forging links with other PYP schools and international organizations with which it shares common aims and problems.

In summary, in seeking internationalism in our schools we need to look first at what our students are learning, at the people we are nurturing. In striving to make it happen, and looking for indicators for success, we need to look everywhere, since all aspects of the school, from philosophy through policy to practice, will reflect either the presence or the absence of a sensitivity to the special nature of our schools.

On examining the student profile and the factors of internationalism, the reader may be tempted to point out that these elements would be desirable in national schools and in international schools. Internationalism in education is, thankfully, not the sole property of international schools. It is an ideal towards which all schools should strive but one which carries a greater imperative for PYP schools.
Language perspective

The PYP recognizes that language, our major means of thinking and communicating, is fundamental to learning, underpinning and permeating the whole curriculum. It is not only learning language but also learning about language and through language and we should nurture an appreciation of the richness of language, including a love of literature. Traditionally language has been treated in a fragmented way, with separation of the strands within language and of language from other areas of the curriculum. The PYP’s approach to language seeks to lessen this fragmentation. While the four co-constructive strands of listening, speaking, writing and reading can be observed separately, they are interrelated and interactive, with learning in one supporting learning in another. This is of particular relevance for international schools, where every teacher is a language teacher.

The PYP considers language from the points of view of homeroom teachers, teachers of the language of instruction (often ESL), teachers of other languages (often the host country language) and teachers of mother tongue languages. The student profile identified applies to each student in every language taught, although the means and pace of teaching them may, and will, differ in different contexts.

Language does much more than promote cognitive growth: the PYP believes that mother tongue language development is crucial for maintaining cultural identity and emotional stability and that acquisition of more than one language enriches personal growth and helps facilitate international understanding. International schools have a special responsibility to recognize and support each and every aspect of language development.

Science and technology perspective

Science is viewed by the PYP as the exploration of behaviour and the interrelationships among the natural, physical and material worlds using the rational process of scientific inquiry; technology is viewed as the application of the principles of science.

The PYP recognizes the importance of science in an international curriculum as science is universal and cuts across gender, cultural, linguistic and national bias and transcends boundaries.

The inclusion of science and technology within the curriculum leads students to an appreciation and awareness of the world as it is viewed through the eyes of the scientist. It develops an understanding of, and competence in using, the facilities of a rapidly changing scientific and technological world, while gaining a positive image of science and technology and its contribution to the quality of life today.

The science and technology process, by encouraging hands-on experience and inquiry learning, enables the individual to make informed and responsible decisions, not only in science and technology but also in other areas of life.

Mathematics perspective

Our rapidly changing technological world is placing ever increasing demands on the mathematical skills and understanding of its citizens. As the PYP has considered how it could help students meet these demands, it has become clear that the place of mathematics in the curriculum is as a service discipline, providing a global language through which we make sense of the world around us. Such is the power of mathematics in describing and analysing that it has become a highly effective tool for solving problems.

The PYP wants students to become fluent users of this language and look on mathematics as a way of thinking rather than as a fixed body of knowledge.

Much of the failure of traditional mathematics curriculums to teach the discipline well derives, in the PYP’s view, from the attempt to impart a body of knowledge directly to students. It is our conviction that students acquire mathematical understanding by constructing their own meaning, concept by concept, through ever increasing levels of abstraction. Moreover, it is fundamental to the PYP’s philosophy that, since it is to be used in context, mathematics needs to be taught in relevant, realistic contexts.

Beyond this, however, the PYP believes that students can appreciate the intrinsic fascination of mathematics and explore the world through its unique perceptions.

Social studies perspective

Social studies is viewed by the PYP as the study of people in relation to their past, their environment and their society. Science is viewed by the PYP as the exploration of behaviour and the interrelationships among the natural, physical and material worlds using the rational process of scientific inquiry; technology is viewed as the application of the principles of science.

Social studies helps students to develop their personal, family, ethnic and cultural identities; to make informed and responsible decisions, not only in science and technology but also in other areas of life.

The pluralistic nature of communities within and among nations, and the relationships between local and global concerns and issues, are addressed through the study of the host society, the students’ own cultures and the cultures of peoples not directly represented in the school’s community. When social studies in the international school asks “What history?”, “What geography?” and “What social framework?”, it leads a diverse student body to a wide understanding of humankind.

Social studies examines human diversity and human commonalities, using the perspectives and experiences of the school’s families, staff and host society.

Social studies does all this best through a questioning approach in which students create their own knowledge and understanding. Students and teachers exploring, investigating and searching for answers together, develop historical, geographical and social concepts which are important in understanding today’s social world.

Social studies is an integrated area of inquiry. The unique perspectives of a number of disciplines contribute to our understanding of human activity. For the purpose of this curriculum these disciplines have been grouped as follows: History is the study of what we think is important about the human past. Students need to develop an understanding of themselves and their society in relation to the past, its influences on the present and its implications for the future.

Geography is the study of the relationship between people and their created and natural environment. Students need to develop a sense of the physical reality of the world, where they are in it and the variety of human activity.

Society is the study of people and their relationships. It draws on the disciplines of anthropology, economics, ethics, politics, psychology and sociology. Students need to develop an understanding of how human values shape social systems.

Social studies in the international school goes beyond respecting and valuing people’s rights to be different. It is grounded in a strong and unequivocal stand for universal human rights, justice and equality. If a difference occurs between the values of a specific culture and universal human rights, social studies in the international school leads students to value the universal, while respecting the perspective of the specific culture.

Beliefs and values

Science is viewed by the PYP as the exploration of behaviour and the interrelationships among the natural, physical and material worlds using the rational process of scientific inquiry; technology is viewed as the application of the principles of science.

The PYP recognizes the importance of science in an international curriculum as science is universal and cuts across gender, cultural, linguistic and national bias and transcends boundaries.

The inclusion of science and technology within the curriculum leads students to an appreciation and awareness of the world as it is viewed through the eyes of the scientist. It develops an understanding of, and competence in using, the facilities of a rapidly changing scientific and technological world, while gaining a positive image of science and technology and its contribution to the quality of life today.

The science and technology process, by encouraging hands-on experience and inquiry learning, enables the individual to make informed and responsible decisions, not only in science and technology but also in other areas of life.
In developing an international curriculum for younger learners, the PYP defines curriculum as broad and inclusive. The PYP takes the position that the school’s curriculum includes all those student activities, academic and non-academic, for which the school takes responsibility, since they all have an impact on student learning.

Furthermore, given the PYP’s commitment to continuous school improvement, it is obvious that the development of the written curriculum, the expression of ideas on paper, is necessary; but, equally obviously, this alone is not sufficient.

The interpretation of these ideas into daily practice, by teachers working in classrooms around the world, matters. The PYP has, therefore, given equal emphasis to methodology, to the taught curriculum, to suggestions for examining and improving our practice and to the provision of inservice support.

The third element in the PYP’s definition of curriculum—assessing the actual learning which takes place for each student—is often the most frequently neglected. The development of a range of meaningful assessment strategies, the focus on the learned curriculum, brings balance to our work and reminds us of its purpose.

The PYP’s definition of curriculum, then, emerges as comprising three interrelated components. In keeping with the PYP’s commitment to inquiry, these three components are expressed in the form of the following three open-ended questions, each of which compels us to think deeply about our own practice with regard to student learning:

**What do we want to learn?**

The written curriculum

the identification of student learning

within a curriculum framework

**How best will we learn?**

The taught curriculum

the theory and application of good classroom practice

**How will we know what we have learned?**

The learned curriculum

the theory and application of effective assessment

The PYP chooses to use the pronoun “we” in each question, rather than referring directly to the students, for reasons which reflect the PYP’s beliefs. While recognizing that the school’s primary responsibility is obviously for student learning, the PYP wishes to make clear its position that:

- given that, in a school which is a community of learners, everyone is a learner, we as teachers must continue to learn, both about the content with which we are engaged and about our own practice
- presenting the questions in this form prompts us to present them in a similar way to students, therefore directly engaging them in their own learning.
In PYP documents the three questions are presented as a cycle:

- What do we want to learn?
- How will we know what we have learned?
- How best will we learn?

The words at the centre of this diagram convey the belief that students construct their own meaning. The PYP is convinced by many of the principles of the constructivist approach to explaining learning. Put very simply, the PYP believes that students bring to the learning situation their own prior knowledge and engage with the curriculum through the activities designed by the teacher. In the context of this total learning environment, the students make sense of their experiences or construct meaning. Our responsibility is to identify the students’ prior knowledge, provide appropriate experiences, assess their new learning and begin the cycle anew.
What do we want to learn?  
The written curriculum

The PYP strives for a balance between the search for understanding, the acquisition of essential knowledge and skills, the development of positive attitudes and the opportunity for positive action.

In terms of achieving this balance, the PYP emphasizes five components of the written curriculum. These are referred to as the essential elements of curriculum and they are as follows:

<table>
<thead>
<tr>
<th>Essential elements</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Concepts</strong></td>
</tr>
<tr>
<td>powerful ideas which have relevance within and across the disciplines and which students must explore and re-explore in order to develop understanding</td>
</tr>
<tr>
<td><strong>Knowledge</strong></td>
</tr>
<tr>
<td>significant, relevant, subject matter we wish the students to explore and know about</td>
</tr>
<tr>
<td><strong>Skills</strong></td>
</tr>
<tr>
<td>those things the students need to be able to do to succeed in a changing, challenging world</td>
</tr>
<tr>
<td><strong>Attitudes</strong></td>
</tr>
<tr>
<td>dispositions which are expressions of fundamental values, beliefs and feelings about learning, the environment, and people</td>
</tr>
<tr>
<td><strong>Action</strong></td>
</tr>
<tr>
<td>demonstrations of deeper learning in responsible behaviour through positive action and service; a manifestation in practice of the other essential elements</td>
</tr>
</tbody>
</table>

Figure 4 The essential elements of the written curriculum

In the pages which follow, each of these elements is explored more fully so that the reader may gain an insight into the significance of each element, how and why it has been selected and how it will be incorporated into classroom practice.
Concepts: what do we want the students to understand?

Why include concepts as an essential element?

The decision to structure the PYP curriculum around important concepts or big ideas is driven by these beliefs:

- A good curriculum offers a balance between the acquisition of essential skills and knowledge and the search for meaning. Education is without meaning if students never really understand.

- Education for understanding, with a focus on important ideas, has often been sacrificed to a superficial introduction to isolated facts and skills. The pressure to cover the syllabus and the expansion of the curriculum have resulted in many students leaving school without ever really understanding.

- By starting with the students prior knowledge, and by confronting and extending their early conceptions, we begin to promote real understanding.

- The exploration and re-exploration of concepts lead students towards a sense of the essence of each discipline and an appreciation of ideas which transcend disciplinary barriers. If concepts are approached from a range of perspectives, students can gradually arrive at a deeper understanding.

- Transdisciplinary units structured around concepts provide a context in which students can understand and, at the same time, acquire essential knowledge, skills and attitudes.

In summary then, the driving force at the heart of the PYP curriculum is a set of powerful ideas, or concepts, which we believe have great significance within each discipline and which transcend disciplinary barriers. These concepts provide a structure for the exploration of significant content. In the course of this exploration, students acquire and practise essential skills and reach a deep understanding of the concepts.

Is it possible to identify a set of concepts around which to structure a curriculum?

Several years of research have been carried out involving the analysis of curricular models in use in different national systems and in international schools. This research has focused on, firstly, whether or not there was a consensus on a set of concepts in which each has universal significance, and secondly, the status and role given to concepts in the various curriculum models. The results have led the PYP to conclude that there are clusters of important ideas which can usefully be grouped under a set of overarching concepts, each of which has major significance, regardless of time or place, within and across disciplines.

Having reached these conclusions, the PYP has designed a conceptual framework for the curriculum, structured around a set of ideas or key concepts. It is realized that these are not, in any sense, the only concepts worth exploring. On the contrary, the concepts which have been selected serve more as labels for clusters of interesting ideas. Taken together, they form a powerful set of ideas which drive the teacher/student constructed research projects, the units of inquiry, which lie at the heart of the PYP curriculum.
Which concepts were chosen and why?

The PYP has constructed a set of eight concepts, each of which, it is felt, is of major significance in the design of a transdisciplinary curriculum. These concepts are:

- Form
- Function
- Causation
- Change
- Connection
- Perspective
- Responsibility
- Reflection

Each of these key concepts is presented in figure 5 together with:

- **a definition**: a generic explanation, provided so that everyone using the curriculum is working with a common understanding of terms
- **a rationale**: the reasons for the selection of the concept as being important for our work with international school students
- **examples of related concepts**: some of the ideas from the discipline areas which relate to this concept, provided as a springboard for the generation of further research questions
- **a key concept question**: the key question which arises from this concept, presented in the form most useful for driving inquiry.

Each key question is presented here in its most basic, generic form, for example, “What is it like?” When working on a unit with a particular focus, for example, geographical, more specifically discipline-related questions will be framed, for example, “What is this place like?”

In what sense do these concepts drive the curriculum?

The PYP is committed to the principle that structured, purposeful inquiry is a powerful vehicle for real learning, learning which promotes genuine understanding and which challenges the students to engage with important ideas. Hence the PYP maintains a commitment to a concept-driven curriculum.

The PYP has concluded the following:

- Since the PYP is committed to inquiry as a vehicle for learning, the natural way to present the key concepts is in the form of broad open-ended questions.
- Presented in this way, the concepts liberate the thinking of teachers and students, suggesting a range of further questions, each one leading to productive lines of inquiry.
When viewed as a set of questions, the concepts form a research tool which is both manageable and open-ended. The concepts are not only key in the sense of important. They also provide a key—a way into a body of knowledge through structured inquiry. They place no limits on breadth of knowledge or depths of understanding and therefore provide access to every student, regardless of particular aptitudes.

These questions should not be interpreted in any restrictive sense, as the only questions, to be used in strict order, or to be given equal weight in every unit. Rather, they represent an approach, a springboard, an introduction to a way of thinking about teaching and learning.

The PYP therefore presents the concepts which are central to the curriculum in the form of key questions. It is these questions, used flexibly by teachers and students when planning an inquiry-based unit, which shape that unit, giving it direction and purpose. It is in this sense that the key questions, and the ideas to which they relate, are said to drive the PYP curriculum.

It is also recognized that these concepts have different applications and interpretations within each discipline. The concepts, with their generic and discipline-specific definitions, are presented in figure 6.
<table>
<thead>
<tr>
<th>Reflection</th>
<th>Definition:</th>
<th>The understanding that there are different ways of knowing and that it is important to reflect on our own conclusions, both with respect to the methods of reasoning we have employed and the quality and the reliability of the evidence we have considered.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rationale:</td>
<td>This idea was selected because the ability to observe, identify, describe and categorize is fundamental to human learning within and across all disciplines.</td>

<tr>
<td>Key question: How is it connected to other things?</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Causation</th>
<th>Definition:</th>
<th>The understanding that things do not just happen, that there are causal relationships at work and that actions have consequences.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rationale:</td>
<td>This idea was selected because of the importance of prompting students to ask “Why?” and of helping them to recognize that actions and events have reasons and consequences. The analysis of causal relationships is significant within and across all disciplines.</td>
<td></td>
</tr>
<tr>
<td>Examples of related concepts:</td>
<td>consequences, sequences, patterns, impact</td>
<td></td>
</tr>
<tr>
<td>Key question: Why is it like it is?</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Function</th>
<th>Definition:</th>
<th>The understanding that everything has a purpose, a role or a way of behaving which can be investigated.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rationale:</td>
<td>This idea was selected because the ability to analyse function, role, behaviour and the ways in which things work, is fundamental to learning within and across all disciplines.</td>
<td></td>
</tr>
<tr>
<td>Examples of related concepts:</td>
<td>behaviour, operations, pattern, role, systems</td>
<td></td>
</tr>
<tr>
<td>Key question: How does it work?</td>
<td></td>
<td></td>
</tr>
</tbody>

<tr>
<td><em>(Function)</em></td>
<td>Everything has a purpose, a role or a way of behaving which can be investigated.</td>
<td>Language is used for a variety of purposes depending on the circumstances.</td>
<td>The examination of systems, relationships, mechanics, components and patterns.</td>
<td>The special activities, properties or purposes, natural or endowed, of a creature or thing.</td>
<td>How events or relationships happen among people or the interaction between people and the environment.</td>
</tr>
<tr>
<td><strong>Why is it like it is?</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><em>(Causation)</em></td>
<td>Things do not just happen. There are causal relationships at work and actions have consequences.</td>
<td>Language has an effect on, and is affected by, everything.</td>
<td>The consideration of the organization, process, application and consequences of actions.</td>
<td>The effect brought about by an intended or unintended action or reaction.</td>
<td>Human actions and events have causes, antecedents and consequences which affect how people interact with each other and with their environment.</td>
</tr>
<tr>
<td><strong>How is it changing?</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><em>(Change)</em></td>
<td>The process of movement from one state to another. It is universal and inevitable.</td>
<td>Language is not static; it changes constantly.</td>
<td>Looking for evidence of change, analysing change and making predictions.</td>
<td>Change is an inevitable aspect of the physical world as things become different or pass from one form or phase to another. Change can be natural or brought about and accelerated by outside influences.</td>
<td>Understanding the nature of social change (individual, group, cultural, or institutional), and how and why humans, over time and space, effect changes or respond to it.</td>
</tr>
<tr>
<td><strong>How is it connected to other things?</strong></td>
<td>We live in a world of interacting systems in which the actions of any individual element affect others.</td>
<td>Language is central to life. It is the major connecting system within, between and among all societies.</td>
<td>The examination of systems and strategies to identify different kinds and levels of relationships within and beyond the strands of mathematics.</td>
<td>The natural world is full of interacting systems in which parts and sets depend on each other to form a working whole.</td>
<td>The social world comprises interacting systems in which the actions of individuals or groups affect each other and the environment. Events, people and places are part of an elaborate web of interdependent human systems.</td>
</tr>
<tr>
<td><strong>What are the points of view?</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><em>(Perspective)</em></td>
<td>What constitutes “knowledge” represents perspectives. Different perspectives lead to different understandings, interpretations and findings. Perspective may be individual, cultural or disciplinary.</td>
<td>Language can be interpreted and meaning expressed in different ways.</td>
<td>In mathematics this means, “What are the different ways of looking at it?” It is about the developing awareness of, and respect for, varied interpretations and the critical evaluation of explanations, strategies and solutions.</td>
<td>Events and findings can be interpreted differently, depending on knowledge, experience and motives. The difference between empirically proven facts and supposition must be emphasized.</td>
<td>There is no one right way of knowing. Perspective is influenced by other people, by our emotions, past experiences, needs and desires as well as by the influences of our culture and the disciplines.</td>
</tr>
<tr>
<td><strong>What is our responsibility?</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><em>(Responsibility)</em></td>
<td>We are not passive observers of events. We can and must make choices. By doing so we can make a difference.</td>
<td>Language is powerful and can have a profound effect, both positive and negative. Therefore, it must be used responsibly.</td>
<td>Understanding the importance of accuracy and appreciating the obligation to gather, interpret, report and apply data with honesty.</td>
<td>We have a responsibility to the world in which we live. This involves being aware of how scientific knowledge can be used to improve or worsen the quality of life of all living things. Responsibility entails action as well as awareness.</td>
<td>People are not neutral and must consider their individual responsibilities towards their society and towards events and social issues.</td>
</tr>
<tr>
<td><strong>How do we know?</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><em>(Reflection)</em></td>
<td>There are different ways of knowing. It is important to reflect on our conclusions, in terms of our way of reasoning and the quality and reliability of the evidence we have considered.</td>
<td>Language is the means by which we reflect on our experiences and knowledge.</td>
<td>Being able to communicate how we have come to understand an idea, concept or skill.</td>
<td>We must consciously reflect on, and be able to describe, how we gain our knowledge and develop our attitudes.</td>
<td>Reflecting on the ways of knowing about the past and other places and people involves introspection, empathy and the evaluation of sources for objectivity, omission and bias.</td>
</tr>
</tbody>
</table>
Knowledge: what do we want the students to know about?

Why include knowledge as an essential element?

The debate in educational circles on what constitutes essential knowledge will probably be endless. In international schools, the dilemma is particularly acute, especially in certain of the traditional disciplines. “Whose history do we teach?” perhaps sums up the problem.

However, given the PYP commitment to developing a coherent curriculum, the PYP feels it is necessary to offer support to teachers and schools faced with the need to select content.

The PYP position is that students are best served by a coherent programme of study which is commonly agreed on by the school’s teachers and administrators. Such a programme:

- provides students with a shared experience and body of knowledge on which to build and reflect
- ensures better continuity of learning, avoiding redundancy and omissions
- provides a focus for collaboration among teachers, both homeroom and specialist
- provides a focus for the work of curriculum coordinators and providers of professional development
- reduces the pressure of coverage on individual teachers (spreading the responsibly across the primary years—and beyond—allows each individual to cover less but in greater depth)
- provides a rationale for the acquisition of resources.

Is it possible to identify a particular body of knowledge for international schools?

Despite, or perhaps because of, the particular difficulties faced by international schools when selecting content, the PYP feels it is immensely important to take on the task of suggesting a coherent, flexible framework of content, a body of knowledge for international schools. This decision is driven by the belief that:

- there are areas of knowledge which, while important for any student, are of special significance in the international school setting
- there are areas of knowledge which, while frequently studied in national schools, take on a whole new significance when approached from the perspective of an international school student. For example, the popular topic of homes changes in its nature when approached from the point of view of students for whom home is an elusive concept, who may have changed homes several times in a few years and whose parents, even siblings, come from different homes.

The PYP recognizes that it would be inappropriate to attempt to define any narrow, fixed body of knowledge as the essential content which every student should know. Accepting this, the task has been approached from a different perspective. Rather than designing a fixed syllabus, the PYP has set out to identify themes (figure 7)—areas of knowledge—which:

- have significance for all students, all cultures
- offer students the opportunity to explore knowledge which is of genuine importance in understanding the human condition
- address the fields of knowledge which form the traditional disciplines but present these in a way which transcends these disciplines, therefore facilitating transdisciplinary planning and teaching
- will be revisited throughout the students’ years of schooling, the end result being an articulated curriculum content, from pre-kindergarten to secondary school.
These themes, as well as the student profile, provide the organizing structure for the school’s framework of content, or programme of inquiry.

The PYP would suggest that the themes described are worthy of consideration by all schools and that they will provide a basis for discussion as individuals in a school work together to develop a transdisciplinary programme of inquiry which meets their school’s needs.

In selecting individual units, structured around the PYP planner, the following are proposed as useful criteria. Each unit should be:

- **significant**: contributing to an understanding of meaningful, important life experiences and therefore to an understanding of the essence of the overall theme
- **relevant**: linked to the students’ prior knowledge and experience and therefore placing learning in a more meaningful context for the students
- **engaging**: having the potential to interest the students and actively engage them in their own learning
- **challenging**: having the potential to extend the prior knowledge and experience of the students.

Schools should also explore the possibilities for links between the units taught at different age bands so that the programme is articulated both vertically and horizontally.
The PYP programme of inquiry
Organizing themes

1. An inquiry into  
   **Who we are**
   An exploration of the nature of the self; of our beliefs and values; of personal, physical, mental, social and spiritual health; of our families, friends, communities and cultures; of our rights and responsibilities; of what it means to be human.

2. An inquiry into  
   **Where we are in place and time**
   An exploration of our orientation in place and time; of our personal histories; of history and geography from local and global perspectives; of our homes and journeys; of the discoveries, explorations and migrations of humankind; of the contributions of individuals and civilizations.

3. An inquiry into  
   **How we express ourselves**
   An exploration of the ways in which we discover and express our nature, ideas, feelings, beliefs and values through language and the arts.

4. An inquiry into  
   **How the world works**
   An exploration of the physical and material world; of natural and human-made phenomena; of the world of science and technology.

5. An inquiry into  
   **How we organize ourselves**
   An exploration of human systems and communities; of the world of work, its nature and its value; of employment and unemployment and their impact on us and the world around us.

6. An inquiry into  
   **Sharing the planet**
   An exploration of our rights and responsibilities as we strive to share finite resources with other people and with other living things; of communities and of the relationships within and between them.

Figure 7 The organizing themes of the PYP programme of inquiry
### What do we want to know about language?

#### Programme of inquiry

**Metalanguage:**
- the use of language to learn about language
  - language as a system of communication
    - the internal structures (semantics, syntax, pronunciation)
    - the reading process
    - the writing process
  - acquisition and development of language
  - diversity of functions of language
  - variety in and between languages and dialects
  - historical, geographical and societal influences on language
  - language as a power in society
  - language as a means of reflection

**Transdisciplinary language:**
- the language of other disciplines
  - the language of the arts
  - the language of mathematics
  - the language of science
  - the language of social studies

**Literature:**
- the body of written work deemed worthy of aesthetic merit
  - literature as a means of understanding oneself and others
  - variety in literary forms, structure, elements and purposes

<table>
<thead>
<tr>
<th>Data handling:</th>
<th>Data handling allows us to make a summary of what we know of the world and to make inferences about what we do not know.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Statistics:</td>
<td>• Data can be recorded, organized, represented and summarized in a variety of ways to highlight similarities and differences. It is important to remember that the chosen format should illustrate the information without bias or distortion.</td>
</tr>
<tr>
<td>Probability:</td>
<td>• There are ways to find out if some outcomes are more likely than others. Probability can be expressed qualitatively by using terms such as unlikely, certain or impossible. It can be expressed quantitatively on a numerical scale.</td>
</tr>
<tr>
<td>Measurement:</td>
<td>To measure is to attach a number to a quantity using a chosen unit. The degree of approximation, and therefore accuracy, depends on the measuring device and the measurer.</td>
</tr>
<tr>
<td>Shape and space:</td>
<td>The regions, paths and boundaries of natural space can be described by shape. Students need to understand the interrelationships of shapes and the effect of changes to shapes in order to interpret, understand and appreciate our two and three dimensional world.</td>
</tr>
<tr>
<td>Pattern and function:</td>
<td>The study of mathematical patterns and functions enables us to organize and understand most observations of the world around us.</td>
</tr>
<tr>
<td>Pattern:</td>
<td>• There are repetitive features that can be identified.</td>
</tr>
<tr>
<td>Function:</td>
<td>• There are generalized rules that describe patterns.</td>
</tr>
<tr>
<td>Number:</td>
<td>Numbers are used to determine or define quantities or relationships, to measure, to make comparisons, to find locations and to read codes. We use numbers to interpret information, make decisions and solve problems.</td>
</tr>
<tr>
<td>Properties of number:</td>
<td>• Numbers can be used to describe quantities and relationships between and among quantities.</td>
</tr>
<tr>
<td>Place value:</td>
<td>• The value attributed to a digit depends on its place within a base system.</td>
</tr>
<tr>
<td>Estimation:</td>
<td>• The degree of precision needed in calculating depends on how the result will be used.</td>
</tr>
<tr>
<td>Computation:</td>
<td>• The operations of addition, subtraction, multiplication and division are related to one another and are used to obtain numerical information.</td>
</tr>

## What do we want to know about science and technology?
### Programme of inquiry

### Living things:
- **Ourselves**
- **Animals**
- **Plants**

The study of humans and other animals, plants, and the environment and the interactions between them.

### Earth and space:
- **Water**
- **Land**
- **Atmosphere**
- **Space**

The study of the planet earth and its relationship to the universe.

### Materials and matter:
- **Gases**
- **Liquids**
- **Solids**

The study of the origins, properties and uses of natural and human-made solids, liquids and gases.

### Forces and energy:
- **Sound**
- **Movement**
- **Magnetism**
- **Gravity**
- **Electricity**
- **Light**
- **Heat**

The study of energy, its origins and transfer, and its effects.

### What do we want to know about the arts?

#### Programme of inquiry

**Music:**
The study and exploration of sound and the expressive use of musical elements through the singing of songs and the playing of instruments. Students develop musical ideas in composition using musical notation. Students will gain an appreciation and awareness of music in all its forms from a range of times, places and cultures.

#### Performing—singing:
- Students will sing a repertoire of songs on their own and with others displaying confidence, expression and an awareness of musical elements such as pitch, rhythm etc.

#### Performing—playing instruments:
- Students will play increasingly complex musical pieces using a range of instruments demonstrating style, expression, and an understanding of melodic direction, tempo and dynamics. Students will have the opportunity to perform solo and as part of an ensemble for an audience, following directions from a conductor.

#### Creating/composing:
- Students will use their imagination and musical experience to organize sounds into various forms including verse, chorus-binary, etc to create compositions that communicate specific ideas or moods. Students will use traditional notation to record their compositions.

#### Listening:
- Students will identify and describe various musical elements such as rhythmic patterns, melodic patterns and form. Students will distinguish between a range of instrumental sounds and have the opportunity to respond to different styles of music, and music from different times and cultures.

**Drama:**
The study of dramatic performance and production. Students will work independently and cooperatively in groups drawing stimuli from the environment, and using a range of performance conventions to create effective dramas.

#### Drama for understanding:
- Students will use drama to examine concepts taken from the particular unit of inquiry being studied. They will use role play to view a situation from the perspective of another person and to communicate that perspective using language and gesture.

#### Storytelling and playmaking:
- Students will explore some of the basic elements of drama, such as role, plot, situation and space, through devising or adapting drama productions.

#### Performance skills:
- Students will develop and portray characters and remain in role in a given situation by using voice, body and gesture.

#### Personal and social development:
- Students will develop negotiation skills and work independently and cooperatively in small groups.

#### Reflection, evaluation and appreciation:
- Students will reflect on their own work, and the work of others in order to enhance performance.

#### Drama in society, cultural perspectives and world theatre:
- Students will discuss experiences of performing arts explaining the way a story was communicated, recognizing theatrical conventions from other cultures and periods while identifying those elements of the production that were effective and those that were not.

**Visual arts:**
The study and appreciation of artworks from a range of cultures and media. Students will become keen observers of their environment by identifying principles of art and design in the world around them. They will choose appropriate materials and use previous experience to communicate their ideas effectively. Students will provide and accept constructive criticism of their own artwork and that of others.

Skills: what do we want the students to be able to do?

Why include skills as an essential element?

The search for understanding is central to the beliefs of the PYP. However, the emphasis on the development of conceptual understanding does not preclude a recognition of the importance of developing skills. The construction of meaning and, therefore, understanding is complemented by the students’ acquiring and applying a range of skills. These skills are best developed in the context of meaningful situations such as those offered by the PYP units of inquiry.

The PYP position is that, in order to conduct purposeful inquiry and in order to be well prepared for further education and for life beyond school, students need to master a whole range of skills beyond those normally referred to as basic. These include skills which transcend the individual disciplines.

What skills does the PYP suggest? (See figure 14)
Self-management skills

- Gross motor skills
  Exhibiting skills in which groups of large muscles are used and the factor of strength is primary.

- Fine motor skills
  Exhibiting skills in which precision in delicate muscle systems is required.

- Spatial awareness
  Displaying a sensitivity to the position of objects in relation to oneself or each other.

- Organization
  Planning and carrying out activities effectively.

- Time management
  Using time effectively and appropriately.

- Safety
  Engaging in personal behaviour which avoids placing oneself or others in danger or at risk.

- Healthy lifestyle
  Making informed choices to achieve a balance in nutrition, rest, relaxation and exercise; practising appropriate hygiene and self-care.

- Communication skills

  - Listening
    Listening to directions; listening to others; listening to information.

  - Speaking
    Speaking clearly; giving oral reports to small and large groups; expressing ideas clearly and logically; stating opinions.

  - Reading
    Reading a variety of sources for information and pleasure; comprehending what has been read; making inferences and drawing conclusions.

  - Writing
    Recording information and observations; taking notes and paraphrasing; writing summaries; writing reports; keeping a journal or record.

  - Non-verbal communication
    Recognizing the meaning of visual and kinaesthetic communication.

- Social skills

  - Accepting responsibility
    Taking on and completing tasks in an appropriate manner; being willing to assume a share of the responsibility.

  - Respecting others
    Listening sensitively to others; making decisions based on fairness and equality; recognizing that others’ beliefs, view points, religions and ideas may differ from one’s own; stating one’s opinion without hurting others.

  - Cooperating
    Working cooperatively in a group; being courteous to others; sharing materials; taking turns.

  - Resolving conflict
    Listening carefully to others; compromising; reacting reasonably to the situation; accepting responsibility appropriately; being fair.

  - Group decision making
    Listening to others; discussing ideas; asking questions; working towards and obtaining consensus.

  - Adapting a variety of group roles
    Understanding what behaviour is appropriate in a given situation and acting accordingly; being a leader in some circumstances, a follower in others.

- Research skills

  - Formulating questions
    Identifying something one wants or needs to know and asking compelling and relevant questions which can be researched.

  - Observing
    Using all the senses to notice relevant details.

  - Planning
    Developing a course of action; writing an outline; devising ways of finding out necessary information.

  - Collecting data
    Gathering information from a variety of sources, such as measuring, maps, polls, surveys, direct observation, resource books, films, people and exhibitions.

  - Recording data
    Describing and recording observations, by drawing, note taking, making charts, tallying, writing statements.

  - Organizing data
    Sorting and categorizing information; arranging into understandable forms, such as narrative descriptions, tables, timelines, graphs and diagrams.

  - Interpreting data
    Drawing conclusions from relationships and patterns which emerge from organized data.

  - Presenting research findings
    Effectively communicating what has been learned; choosing appropriate media.

- Thinking skills

  - Acquisition of knowledge
    Gaining specific facts, ideas, vocabulary; remembering in a similar form.

  - Comprehension
    Grasping meaning from material learned; communicating and interpreting learning.

  - Application
    Making use of previously acquired knowledge in practical or new ways.

  - Analysis
    Taking knowledge or ideas apart; separating into component parts; seeing relationships; finding unique characteristics.

  - Synthesis
    Combining parts to create wholes; creating, designing, developing and innovating.

  - Evaluation
    Making judgments or decisions based on chosen criteria; standards and conditions.

  - Dialectical thought
    Thinking about two or more different points of view at the same time; understanding both points of view; being able to construct an argument for either point of view based on knowledge of the other; realizing that others can also take one’s own point of view.

  - Metacognition
    Analysing one’s own and others’ thought processes; thinking about thinking and thinking about how one thinks and how one learns.

- Communication skills

  - Listening
    Listening to directions; listening to others; listening to information.

  - Speaking
    Speaking clearly; giving oral reports to small and large groups; expressing ideas clearly and logically; stating opinions.

  - Reading
    Reading a variety of sources for information and pleasure; comprehending what has been read; making inferences and drawing conclusions.

  - Writing
    Recording information and observations; taking notes and paraphrasing; writing summaries; writing reports; keeping a journal or record.

  - Non-verbal communication
    Recognizing the meaning of visual and kinaesthetic communication.

- Transdisciplinary skills

- Social skills

- Research skills

- Thinking skills
Attitudes: what do we want the students to feel?

Why include attitudes as an essential element?

While recognizing the importance of concepts, knowledge and skills, the PYP believes that these alone do not make an internationally educated person. It is vital that we also focus on the development of positive attitudes towards people, towards the environment and towards learning.

The PYP does not believe it effective to rely on these attitudes being fostered in an implicit way, as some form of hidden curriculum. It is essential that we address them consciously, professionally and explicitly within the written curriculum, that we design activities which promote positive attitudes and that we consider attitudes when we are designing assessment strategies.

What attitudes does the PYP suggest that schools should encourage?

<table>

Figure 15  Attitudes for students to develop

© IBO 2000
Action: how do we want the students to act?

Why include action as an essential element?

The PYP believes that international education must extend beyond intellectual attainment to include not only responsible attitudes but also thoughtful and appropriate action. International schools can and should meet the challenge of offering all learners the opportunity and the power to choose their actions, to act and to reflect on these actions in order to make a difference in and to the world.

The PYP believes that every student, every year, has the right and the duty to be involved in such action. In order to make the action component of the curriculum as powerful as possible in terms of student learning the PYP advocates a cycle of involvement which provides students with opportunities to engage in meaningful action.

![Figure 16 The action cycle](image)

The action component of the PYP involves service in the widest sense of the word: service to fellow-students, to the staff and to the community. Through such service, students are able to grow both socially and personally, developing skills such as cooperation, problem solving, conflict resolution and creative and critical thinking. These actions are, moreover, ways in which the students exhibit their commitment to the attitudes that we seek to engender within the PYP classroom.

Is it possible for students to identify appropriate actions in which to engage?

Effective action does not need to be grandiose. On the contrary, it begins at the most immediate and basic level: in the family, in the classroom, in the hallways and in the playground. Even very young children can have strong feelings about fairness and justice and we, as educators, can facilitate positive expressions of these opinions. The PYP has chosen to do so by identifying responsibility as one of the key concepts driving the curriculum and by including the question, “What is our responsibility?” as a key question.
The PYP believes not only that it is possible for students to identify appropriate actions but also that we have a responsibility to enable them to choose their actions carefully, to facilitate these actions and to encourage them to reflect on the actions they undertake. This is viewed as an important part of students’ active participation in their own learning.

What actions does the PYP suggest that schools should encourage?

The PYP recognizes the problems inherent in advocating action and the importance of presenting a balanced viewpoint. Voluntary action must remain precisely this, if we truly believe in the values we advocate. Furthermore, we must remember that today’s complex issues do not often suggest simple or self-evident solutions and that inaction is also a legitimate choice; indeed, sometimes, inaction may be the best choice.

Each school should develop its own action component based on the needs of its students and community. Therefore, the precise actions in which schools may engage will differ.

Guidelines for implementation

Effective action:

- should be voluntary and involve students in exercising their own initiative and in taking responsibility for their actions
- should be based on balanced understandings and not biased stereotypical thinking
- usually begins in a small way and arises from genuine concern and commitment
- is usually, for younger children, grounded in their own concrete experience
- demands appropriate adult support in order to facilitate students’ efforts and to provide them with alternatives and choices
- is not always concerned with raising funds.
Synthesizing the essential elements

Synthesizing through the planner

The PYP presents an analysis of the written curriculum in terms of five essential elements: concepts, knowledge, skills, attitudes and action. For these elements to work in practice and actually to drive the taught curriculum they must be brought together into a meaningful synthesis through planning, teaching and assessment.

The PYP proposes an approach to teaching and learning which centres around the design of transdisciplinary units of inquiry recorded on the PYP planner. Each of these units:

- stands alone as a significant, relevant, challenging learning experience
- contributes to a coherent, school-wide programme of inquiry which is framed in terms of themes of universal importance
- draws together elements of different disciplines into a meaningful whole
- is planned by teams of teachers working in collaboration, guided by a set of questions for teachers (these questions create the structure for the PYP planners, provided for the purpose of collaborative unit design)
- is driven by a set of key questions which are conceptually based
- involves students in a range of learning activities planned in response to the key questions
- builds on the prior knowledge of the students in the context of meaningful research
- is constructed and conducted in such a way as to promote positive attitudes
- requires students to examine their own levels of responsibility and engage in positive action and service.

Through the units of inquiry, then, the essential elements are synthesized into a meaningful whole, a coherent approach to teaching and learning. Teachers and students generate questions which have a conceptual base and are relevant to the context of the unit. Classroom activities are planned as a direct response to these questions. The classroom becomes a centre of structured inquiry through which students acquire and practise skills and build new knowledge. They do so in a climate which fosters positive attitudes and offers opportunities for constructive action. Assessment of student learning focuses on the quality of the students’ research, the breadth and depth of their responses to the set of questions which is driving the unit.

It is important to note that the programme of inquiry does not necessarily constitute a school’s whole programme. The PYP believes that well planned units can provide an ideal context for learning across the disciplines. It also recognizes that disciplines have an integrity and essence of their own which must not be lost. The PYP advocates teaching across the disciplines when it enhances learning but not when the integration results in teaching and learning which is artificial and superficial. Schools must make their own decisions with regard to the level of integration.

Synthesizing through the student profile

The PYP interprets its beliefs and values in the form of a student profile. This profile provides the aims for the curriculum and focuses our attention on the fact that student learning is what schools are about.

The PYP student profile also represents a synthesis of the essential elements. Throughout the primary years the students engage in structured inquiry which synthesizes concepts, knowledge, skills, attitudes and action. In doing so, they develop the attributes and dispositions described in the student profile.

This profile provides powerful goals in all disciplines and, indeed, serves as the aim for the subject-specific sections of the curriculum. Figure 17 expresses the student profile in the context of the disciplines. These subject-specific profiles serve, in the broadest sense, as objectives for the curriculum.

Figure 17 PYP student profile: subject perspectives

© IBO 2000
How best will we learn?  
The taught curriculum

What are the connections between the written curriculum and actual classroom practice— the taught curriculum?

Those familiar with the PYP sometimes ask, “Is it a curriculum or an approach?” The answer is “Both”. The PYP defines curriculum as including approach in recognition of the fact that, in practice, the two are inextricably linked.

The PYP has set out to strengthen these links by developing a curriculum in which classroom practice, the taught curriculum, is a direct reflection of the written curriculum. Therefore:

- in the written curriculum the essential elements of learning—concepts, knowledge, skills, attitudes and action—are identified
- it is recognized that these elements are not completely separable—in the course of the learning process they blend and it is suggested that they are synthesized in two main ways:
  - into a student profile, which reflects the essential elements
  - through key questions which, while conceptually based, reflect aspects of other essential elements
- the teacher plans, with input from the students, thematic units designed to address the student profile
- the activities which are planned for the unit are designed to ensure that, in conducting inquiry structured around the key questions, the profile is addressed.

Therefore, the planning focuses on using the written curriculum to suggest key questions around which to structure inquiry. The teaching focuses on facilitating that inquiry in the classroom and beyond. The taught curriculum is the written curriculum in action.

Why is the PYP committed to this type of teaching?

The PYP is committed to structured, purposeful inquiry, which engages students actively in their own learning. The reason is simple. We believe that this is the way in which students learn in the most constructive manner.

Since its inception the PYP has been infused with a spirit of inquiry. The PYP structures its own work by means of questions such as, “What do we want the students to learn?” In seeking to answer that question the PYP has made a commitment to relevance and quality rather than to quantity. The PYP is convinced that coverage is often the enemy of understanding. The PYP wants the curriculum to emphasize the active construction of meaning, so that students’ learning will be purposeful.

An extensive study of the literature, when combined with practical experience, has led the PYP to the position it now holds, which is one of commitment to structured, purposeful inquiry, which engages students actively in their own learning, because it is believed that this is the way in which students learn best. The PYP believes that students should be invited to investigate important subject matter by formulating their own questions, looking at the various means available to answer the questions and proceeding with research, experimentation, observation and other means that will lead them to their own responses to the issues. The starting point has to be students’ current understanding, and the goal is the active construction of meaning by building connections between students’ experience and information and processes derived from the inquiry into new content.
The PYP suggests that the teacher’s role in this process is to create an educational environment which encourages students to take responsibility, to the greatest possible extent, for their own learning. This means that resources must be provided for each student to become involved in self-initiated inquiry. In the PYP classroom, the teacher facilitates the process of students becoming seekers rather than followers by asking carefully thought out, open-ended questions and by encouraging students to ask questions of each other as well as of the teacher. It goes without saying that the teacher must also model and value inquiry. This is the type of teaching to which the PYP is committed.

How do we plan for this kind of learning?

The PYP recognizes that most curriculum guides provide the basis for planning, usually in the form of learning objectives. They provide a document from which to plan. The PYP has decided that, in support of teachers who are implementing the curriculum, the link between the written curriculum and the taught curriculum should be strengthened. Therefore, the PYP has developed a document with which to plan.

This document, the PYP planner (figures 18 and 19), follows the same principles of learning as every other document the PYP has produced in that it is:

- designed to be used collaboratively
- structured around a set of open-ended questions (see figures 21–24).

Figure 20, referred to as the bubble planner, includes stage by stage guidelines for use.
### Stage 6: To what extent did we achieve our purpose?

*To what extent: were the purposes fulfilled; was the unit relevant, engaging, challenging and significant; were the resources adequate; were the concepts, skills and attitudes addressed?*

### Stage 1: What is our purpose?

_A concise description of the central idea to be addressed and the scope of the inquiry._

**Student questions**

### Stage 4: How best will we learn?
Teacher- and/or student-designed activities which will address the key questions.

### Stage 5: How will we know what we have learned?
The strategies which will be used to assess learning.

**Student self-assessment**

**How will we take action?**
How the students will demonstrate their ability to choose, act and reflect.
Stage 6: To what extent did we achieve our purpose?
To what extent: were the purposes fulfilled; was the unit relevant, engaging, challenging and significant; were the resources adequate; were the concepts, skills and attitudes addressed?

Stage 6

Review the original purpose of the unit. Record any changes or adjustments of emphasis in the purposes you would make if doing this unit again. Record which concepts, skills and attitudes were well covered. Activities which were particularly productive, and those which were not, should also be noted. An indication should be made of the teacher’s overall evaluation of the unit, and any longer term effects or outcomes which resulted. Students are part of this process too. Their evaluation of the activities, the value of the unit and any suggestions or change they made should be recorded here as well.

Stage 1: What is our purpose?
A concise description of the central idea to be addressed and the scope of the inquiry.

a) Central idea:
Stage 1b:
A concise and true statement of a broad understanding or important experiences embedded in the disciplines. It is worth knowing and has enduring value beyond the classroom. It is globally significant and is relevant to the transdisciplinary theme that defines the unit of inquiry. It challenges and extends students’ prior knowledge and is complex enough to provoke genuine student inquiry.

b) An inquiry into:

Stage 2: What resources will we use?
People, places, audio-visual materials, related literature, music, art, computer software, etc.

Stage 2

Having reviewed the available resources, use this space to list the particular people, video tapes, artifacts, local resources, related fiction, computer software, etc on which you will build the unit. This space is not intended for comprehensive lists of conventional resources or bibliographies.
Stage 3: What do we want to learn?
The key questions which will drive the inquiry.

Form
What is it like?

Function
How does it work?

Causation
Why is it like it is?

Change
How is it changing?

Connection
How is it connected to other things?

Perspective
What are the points of view?

Responsibility
What is our responsibility?

Reflection
How do we know?

Teacher questions

Stage 3
Using the key questions as a resource, formulate open-ended questions which will
guide students towards an understanding of the essence of this unit as described in stage
1, the purpose. There or four well formulated questions are all that are required to drive
the inquiry.

The key question boxes above should be used to record which kinds of questions have
been formulated. It is not necessary to have questions under each key question in each
unit. However, it should be possible to formulate questions in all units about
connections, perspectives and responsibility.

Student questions

Stage 3b
Introduce the proposed unit to the students
and ask them what they would like to find
out. Record their questions here. Discuss
with them the questions you consider to be
important.

Stage 4: How best will we learn?
Teacher and/or student designed activities which will address the key questions.

Stage 4
Design a variety of activities which will follow up on the students’
questions and the lines of inquiry prompted by the key questions.
Activities should also be designed with the student profile in mind
as well as specifically relating to the development of
understandings implicit in the key questions. Students should, as
far as possible, be involved in designing activities and deciding on
appropriate strategies for answering the driving questions.

Because assessment is integral, all these activities will be used as
either formative or summative assessment instruments by the
teacher and/or students. They should be designed with this in mind
and clear records should be kept to indicate student progress.

Stage 5: How will we know what we have
learned?
The strategies which will be used to assess learning.

Stage 5a.
Teaching and assessing are part of the same learning
process. Records allow teachers and students to see
progress in the development of understandings, skills and
attitudes.

This column should be used in conjunction with the listing
of activities in stage 4.

Identify here which activities will be used for formative
and summative assessment, and the kinds of strategies and
criteria for assessment that will be used in each case.

How will we take action?
How the students will demonstrate their ability to choose, act and reflect.

In this box write the ways in which the unit may lend itself to presenting action
choices to the students. Not every unit will necessarily have an action component
and in some, the action component will develop spontaneously in the course of
the unit.
Evaluating a written planner for a unit of inquiry

Criteria for evaluating the quality of the planner at each stage of its development:

**Purpose and questions**
- Is the purpose clearly stated?
- Do the key questions reflect the purpose?
- Are the questions clear, open-ended and precise?
- Is the plan appropriate to the development level and interests of the students?
- Is there a direct link between the concept-based questions and the activities?
- Does the unit provide opportunities for:
  - exploring significant content
  - understanding major concepts
  - acquiring relevant skills
  - developing desirable attitudes
  - displaying responsible actions?
- Do the questions and activities promote a global perspective?

**Activities**
- Do the activities reflect a variety of appropriate teaching and learning strategies?
- Will the students be actively engaged?
- Is there room for student initiative?

**Assessment**
- Do the assessment strategies allow for individual differences?
- Does the assessment follow from the purpose?
- Does the assessment allow students to appreciate their progress?

### Language: transdisciplinary language—in a social studies unit of inquiry (Islam)

Figure 24  Further questions: social studies (continued)
What are the forms of kinship, customs, values, beliefs, expectations, language(s), artifacts of the society? Is the culture common to the whole of the country or are there different cultures within the state? Are the same cultural elements common to other groups living in different states? What does it mean to be a world citizen? What is the political system? What is the economic system? Do people have equal access to resources and opportunities? What is the legal system? Is it just? Do all people have equal rights? Are they respected? What are the social controls of the society? What roles do individuals play in the society? What rights and obligations go with those roles? What technological systems, transportation, production, education, does this society have? How does the culture influence the perceptions, emotions and actions of individuals? How is power/authority allocated? How does the election system work? How are leaders removed from power? How is conflicts resolved? How are resources distributed? How is justice dispensed? How does the network of interdependence between the individual and group in the society work? How do the mechanisms for social control, norms and sanctions, in the society work? Is there specialization and division of labour in the family and in the workplace? How has the development of technology affected this society? Which different roles can an individual play in society? How can the different roles of an individual in a society cause conflict? What individuals, groups, institutions, systems have shaped the society? Why have the existing political, economic, legal and social systems developed? Has the environment shaped the nature of society? What is the role of technology in shaping the society? What causes new cultures to develop? What societal factors cause growth, conflict, resettlement, migration, resource management? What societal forces cause people to relocate? In what ways has conflict and its resolution shaped the society? What kinds of beliefs, values and attitudes encourage connections with other peoples? What kinds of values and attitudes discourage or prevent connections with other peoples? How are the beliefs, norms and values of a people today connected with those of their ancestors? What societal factors promote or discourage contact with other societies? How has the specialization of work and the division of labour affected the interdependence of groups? In what ways has conflict and its resolution changed the society? How are social roles connected? What influences our opinions? Can I explain the point of view of others even though I do not agree with it myself? Can I give more than one possible explanation for the actions or behaviours of others? Are the changes that are taking place in society beneficial or destructive? How can conflict be resolved? Would I like a change of role? What role would I most like to play in another culture? What might my lifestyle be if I lived in another culture? Why do people in my community not all value the same things? What rights should all children have? Why do they not have them? How can we be good world citizens? What does it mean to be a world citizen? How can we be a responsible member of my family, class, school, society, world? What is my responsibility to those who are less fortunate? What rights should all children have all over the world? How can I help them to secure their rights? What kinds of organizations and societies exist now that are concerned with preserving the past? How can the world be made a more just place for all humans? Can we be certain that the information we have about society is unbiased, or if it is biased, in what way is it biased? How do we know about this society, its nature, its current state? Have we gathered data from primary sources? Have we gathered data from secondary sources? Is there likelihood of bias or propaganda in the sources? Could the data be interpreted in ways other than it is? Have we examined statistics, graphs, charts? How reliable are own opinions and those of others? Have we left out anything?
What changes will this mean for the school?

It has been stated that the PYP believes in a particular approach to teaching and learning. However, it is also recognized that many educational innovations (or, more accurately, educational reworkings) suffer from the advocacy of a narrow, exclusive approach. The PYP represents an approach in a broad, inclusive sense, in that it provides a context within which:

- a wide variety of teaching strategies and styles can be accommodated, provided that they are driven by a spirit of inquiry and a clear sense of purpose
- the more substantial innovations of recent years can flourish.

The degree of change required to implement this approach at the school-wide level will, obviously, depend on conditions within the school at the time of implementation. To be realistic, however, teachers must recognize that:

- school-wide adoption of the PYP approach will require change not only in the classroom but throughout the school
- this change is likely to be slow, painful and beset with difficulties (these difficulties are always associated with any change which requires people to examine and modify their current practice)
- engaging in this change process will have a beneficial impact on the whole school, the individual teacher and, most significantly, on the quality of student learning, but the struggle is worth it
- the process of change in teaching practice will require substantial support from all teachers.

What changes will this mean for teachers?

Again, the degree of change will depend on the teacher. For those teachers who have grown weary of imposed change for which they see little point, we would stress that the PYP does not expect teachers to discard years of hard-earned skill and experience in favour of someone else’s ideas on good teaching. It is suggested, rather, that teachers engage in reflection on their own practice, both individually and in collaboration with colleagues, with a view to sharing ideas and strengths with the primary aim of improving their teaching to improve student learning. In doing so, they will be modelling the skills and attitudes that have been identified as essential for students.

As an aid to reflection, the PYP has produced a set of generic and subject-specific examples of good practice which it is believed are worthy of consideration by anyone committed to continuous improvement.

Good PYP practice

A PYP classroom can only be fully effective in the context of a PYP school. In schools like these, all constituents are committed to internationalism and learning. Adults and children are encouraged to ask questions, identify problems and seek solutions in the pursuit of continuous improvement towards common goals. A PYP school is infused with a sense of purpose and a spirit of inquiry. Within this setting, each classroom operates as a microcosm of the larger institution.

The classroom is a place of variety and balance. Balance is seen in the attention given both to the pursuit of understanding and to the acquisition of knowledge and essential skills. Variety is there because teachers are resourceful professionals who are in command of a range of teaching and grouping strategies. They select appropriately from this repertoire according to school-wide goals and classroom purpose.

In a PYP classroom, parents are welcomed as partners, with a clear role to play in supporting the school and their own children. They are informed and involved.
Students are actively engaged in planning and assessing their own learning. They are caring and committed. They recognize that the right to a good education is complemented by a responsibility to give of their best as individuals and to contribute to the learning of the whole class.

A PYP classroom is a lively place, characterized by collaborative and purposeful activity. It is also a reflective place, where thoughtful consideration of issues, problems and successes is valued highly.

Above all, and in summary, a PYP classroom is an intelligent place. It is a place in which the easy option is seldom sought and where the expectations are high. It is an environment in which learning knows no limits.

In creating a PYP classroom, the teacher is faced with the challenge of integrating the various disciplines into a cohesive, meaningful whole while ensuring that the essence of each discipline is retained.

The principal means of bringing about integration is through the transdisciplinary units of inquiry which form the heart of the PYP approach. These units are themselves elements in a school-wide, thematic programme of inquiry which ensures continuity of learning for all students.

Good language practice

What is a PYP language classroom like?

The PYP language classroom is a place where language in all its forms is clearly in evidence. There is a busy hum of discussion. The observer is tempted by the inviting book corner, well stocked with reference books, picture books, story books, poetry books, children’s self-made books and books in a variety of languages. Displays include a wide variety of print, including students’ writing, author of the month, questions from the current unit of inquiry, posters, charts, calendars, memoranda and instructions. The listening centre is freely accessible, with a range of fiction and non-fiction audio cassettes available. The clearly labelled writing centre is equipped with a range of materials and equipment—a word processor and printer, a typewriter, different types of paper, envelopes, blank forms, card, bookbinding tape and ready-made blank books.

How does a PYP language classroom work?

Students are engrossed in books at tables, in the book corner and in the quiet area outside the classroom; they move purposefully between the classroom and the quiet area as the task demands, switching readily from individual study to group discussion, seeking advice and comment from peers and teacher as needed. Writing is a significant activity in classes of all ages, with younger students comfortably making independent attempts at spelling, and delighting in sending letters, annotating pictures and making books, while older students work at various stages of the writing process, drafting, revising and editing imaginative stories, expressive poetry, science reports, personal journals and reading responses.

The teacher switches flexibly between individual, group and whole class work. The underlying organization and sense of purpose are clear. The teacher moves easily among the students, working with a group to brainstorm pre-writing ideas, sitting for a while longer to help a reluctant writer to begin, pausing to assist with an individual editing question, gathering specific students for a group conferencing session, turning to advise on an appropriate reference source, collecting the whole class for a summarizing session. The teacher models appropriate behavioural and learning attitudes, speaking and listening respectfully, referring to reference sources when appropriate, enthusiastically sharing ideas about a favourite novel, posing questions on the current unit of inquiry, skillfully guiding students’ lines of questioning, encouraging divergent thinking, sensitively supporting all individuals to aim for their best.

Language is the medium of inquiry. In an inquiry-based PYP classroom, teacher and students enjoy using language, appreciating it both aesthetically and functionally. Literature is an integral part of the curriculum—a series of books read as an author study, host-country fairy tales as part of a social studies unit, a biography as the base for a science investigation, early years counting stories as reinforcement for mathematics development, comparison of illustration techniques to encourage acquisition of art skills. Books are not only enjoyed, they are also discussed and analysed, compared and contrasted.

Why is a PYP language classroom the way it is?

Language is a key factor in the development of international understanding and, as such, has a major role in a PYP classroom. PYP students will commonly be familiar with two or more languages, the learning of each being interdependent. The PYP classroom values and supports the mother tongue and the language of instruction and also aims to extend the students’ access to other languages.

The PYP classroom is flexible enough to cater for a wider than usual range of language and literacy development: because there are so many variables in the students’ backgrounds and experience, it is likely that, even in a single age group of students, there will be enormous diversity in their levels of language and literacy development. This is further affected by the fact that students may often be working in their second or third language; but the fundamental objectives of responsible, competent, confident communication are common to each.
How are language practices changing? (see figure 26)

How is language connected?

Language is a complex web of connections, transcending the artificial separations of schedules and disciplines. The language strands are interdependent, with listening, speaking, reading and writing being taught and learned simultaneously. Language is seen as involving learning language itself, learning about language and learning through language, and is the major connecting element across the curriculum, with students focusing not only on language for its own sake, but also on the languages of science, history, mathematics and other disciplines.

The PYP language classroom extends beyond the classroom walls, with close connections to the central school library/media centre for research, quiet reading and story sessions, and to other classrooms for paired reading activities, shared bookmaking and interviews. The teacher plans in collaboration with other classroom teachers and specialists, ESL and foreign language teachers playing a particularly important role in reinforcing, supporting and extending the classroom work.

Language is also a major connection between home and school and, in the PYP classroom, cooperative activities are common, to optimize development of all the students’ languages. Mother tongue development is actively encouraged and supported: bilingual dictionaries are available in the classroom, letters to parents are often translated before being sent home, students are encouraged to use books in their own language for project work and, often, mother tongue classes are part of the programme.

There are connections with the wider community, the host country’s language and literature deserving and receiving special status, helping students to adjust to and appreciate the culture of the host country.

The PYP language classroom is also connected to the broader world through technology: students aim for literacy in its broadest sense, researching and communicating not only through printed media but also through global electronic networks, exchanging poetry with a live poets group; collecting first-hand information for a unit on water from peers in Alaska, The Netherlands and Western Australia; connecting directly with NASA to access a vast range of multimedia resources.

Figure 26  PYP practices: language
Good mathematics practice

What is a PYP mathematics classroom like?

In a PYP classroom mathematics is a vital and engaging part of students’ lives. The children in the room are very active, with an underlying sense of organization and cooperation. Teachers and students are asking questions of each other, trying out and demonstrating ideas in small and large groups, using the language of mathematics to describe their thinking, generating data to look for patterns and making conjectures. A wide variety of materials is available to all. These manipulatives are constantly in use. There are lists, tables and charts on display showing written and numerical data about which relevant questions are asked and answered.

The number of mathematics resources available is impressive: colourful and thought-provoking posters and children’s work cover the walls; materials, ranging from student collections of keys, foreign money and seashells to store-bought pattern blocks and geoboards, are out on tables; everyday tools, such as measuring jugs, calculators, even cereal boxes, are in use. On the bookshelves are many resource books for the teacher and students, including a wide variety of textbooks, mathematical dictionaries and encyclopedias and children’s literature, which focus on mathematical ideas. The computer area is well stocked with innovative software that encourages the application of mathematics skills and problem solving and the general supplies area has a variety of paper for recording mathematical ideas: different sized squared paper, dot paper and much scribble paper. There may even be a video area where high quality video tapes show how mathematics is used outside the classroom. It is clear where things belong and how they are used.

The mathematics classroom does not work on its own. The students visit younger children to help them with their investigations. Students also work with older children to travel about town in small groups on a treasure hunt, asking and answering questions about dates, times, distance, prices and more. Other teachers and parents come to share their interests and expertise. The school nurse and administrators are involved in providing information and participating in surveys. The school’s parking lot and local shops are visited when collecting data. The community at large provides innumerable opportunities for budding mathematicians to practise their craft.

How does a PYP mathematics classroom work?

Inquiry-based units of study are the entry points into mathematics learning through which students will experience what it is like to think and act as mathematicians. Students and teachers identify together what they already know which might be relevant to the inquiry, what they want to know, what they need to know to answer their questions and how best they might find that out.

The PYP mathematics teacher is well trained in primary mathematics. Personal knowledge of the subject matter is of primary importance. The teacher’s own interest in and development of the discipline is maintained through regular inservice, reading professional journals and, especially, regular contact with colleagues who share the commitment to teaching mathematics through inquiry.

With the curriculum as the guide, the teacher spends time in different ways: walking about while students are working alone, in pairs, in small groups or even as a whole class; asking key questions; challenging the students’ thinking—prompting them to take ideas one step further; and jotting down notes to inform the next stages of learning. The teacher might also gather a group of students with a particular interest or problem to provide more specific help through guidance and practising together.

One of the most important aspects of the teacher’s role is to encourage appropriate mathematical discussion among the student mathematicians—demonstrating the nature of mathematical discourse and the development of conjectures. Students follow simple, polite rules when talking with each other, building on previously mentioned ideas, supporting others in the various stages of learning and sharing their discoveries in a congenial atmosphere. Students see writing down their ideas as a natural step in the process of communicating important ideas. They record in a variety of ways, including drawing pictures, recording numbers and writing in mathematics journals.
All in all, an exemplary PYP mathematics programme consists of a very active and busy community of learners, with the teacher constantly finding ways to combine the students’ needs and interests, and the goals of the curriculum, in engaging and relevant tasks.

**Why is a PYP mathematics classroom the way it is?**

Mathematics is a language which is used to describe the natural world. Students of today need to build an understanding of previously made discoveries as well as discover and describe their own mathematical ideas. Traditionally, mathematical knowledge has been disassembled in schools.

Our vastly expanded knowledge base about learning mathematics, however, tells us that, in fact, people assemble, or construct, mathematical knowledge. This requires us to look at mathematics not as a fixed body of knowledge to be transmitted but as a language and a way of thinking. It is our task as teachers to facilitate this process.

**How are mathematics practices changing?** (See figure 27)

**How is mathematics connected?**

Mathematics, like language, can largely be seen as a service discipline to other parts of the curriculum—providing tools, symbolic language and ways of thinking to the scientist and social scientist.

Mathematics is also a fascinating discipline in its own right. It is the joy and satisfaction of solving problems and finding patterns that has captured and stimulated the most creative minds throughout the ages.

Figure 27  PYP practices: mathematics
Good science and technology practice

What is a PYP science and technology classroom like?

The PYP science and technology classroom provides an environment which stimulates and challenges students’ ideas. A variety of objects, materials and students’ models is displayed at student height around the room. Display boards show examples of students’ work and relevant posters illustrate specific science topics. The class library contains a variety of well illustrated reference books at a wide range of reading levels. On the shelves is an extensive range of equipment for collecting, observing, measuring, recording and presenting data. The students show enthusiasm and work cooperatively in investigating and experimenting.

How does a PYP science and technology classroom work?

In the PYP science and technology classroom, students are engaged in open-ended inquiry through the following.

Formulating questions:  
Students identify something they want or need to know about the biological or physical world. They learn that their own questions can be the impetus for inquiry. They recognize that new questions and problems arise all the time as we observe and collect data.

Observing:  
Students use all the senses, touching, feeling, listening, tasting and smelling, as well as seeing, to notice relevant details of objects or events, resulting in a widening and deepening understanding of the biological and physical world. They choose and use equipment appropriately, to enhance observation.

Planning:  
Students state questions, identify problems, predict, hypothesize and justify. They devise ways of finding out needed information and design experiments and fair tests. They identify ways that findings can be checked and verified.

Collecting data:  
Students gather data from a variety of sources. They continually question, re-test and check data, looking for confirmation or ambiguity. They learn to respect evidence which results from their efforts.

Recording data:  
Students describe and record observations with precision and relevant detail, by drawing, note taking, making charts, tallying and writing statements.

Organizing data:  
Students sort, categorize and order information and arrange it into a variety of suitable forms, such as narrative descriptions, tables, timelines, graphs and diagrams.

Interpreting data:  
Students seek for patterns and relationships among scientific phenomena, drawing conclusions and inferences from relationships and patterns which emerge from organized data. They see new possibilities in the data. They modify earlier hypotheses or explanations in the light of new data and respect reason. They test earlier ideas against new evidence and speculate and hypothesize, moving towards the construction of theories about the natural world.

Presenting research findings:  
Students effectively communicate the solutions to problems, the answers to questions or the evidence for a conclusion. They choose appropriate media. They are honest, presenting information objectively with supporting evidence.
Why is a PYP science and technology classroom the way it is?

Traditionally, knowledge has been disassembled in schools. Our vastly expanded knowledge base about learning, however, tells us that, in fact, people assemble, or construct knowledge. It is our task as teachers to facilitate this process.

How are science and technology practices changing? (See figure 28)

How is science and technology connected?

Science and technology is a vehicle for teaching critical thinking skills and a way of exploring the world. Developing ways of investigating and using evidence enables students to interact with the world around them.

Figure 28  PYP practices: science and technology
Good social studies practice

What is a PYP social studies classroom like?

The PYP social studies classroom is an active, bustling place. Students are working at tables, on the floor, in the corner, alone or in groups. Students and teachers are absorbed, planning, organizing, preparing products, reading to each other, sharing work and reflecting. Visitors are often not noticed.

The PYP classroom is the springboard for social studies learning: learning in the school and the community. The classroom furniture, equipment and materials encourage students to work individually, in pairs, in small groups and as a class. Students use the school library/media centre and computers; visit other classes; interview school personnel, members of the community and local experts; and involve themselves in community and student presentations. Field trips within the immediate school environment, to museums, farms, industrial and commercial centres and other sites are part of the PYP social studies classroom.

The class library is the centre of activity. It contains fiction and non-fiction materials with a wide range of reading levels, presents multiple perspectives and stimulates questioning. Fiction, bibliographies, autobiographies, poetry, drama, myths and legends, documentaries on current world problems, specialized magazines and newspapers abound. It has a reference section which includes dictionaries at different reading levels and in the mother tongues of the students, thesauruses, atlases, almanacs and encyclopedias. Reference materials brought in by students are also available. ESL students add materials in their own languages. Everything is clearly labelled and readily accessible.

A notice board details exhibitions to visit, current events and local experts. Globes and maps with different scales and projections are on hand, as are tape recorders, video cameras, paper, markers and a wide variety of other presentational materials.

The teacher’s resources for curricular units of inquiry are also readily available. These include textbooks, first-hand accounts, video tapes, pictures, pictorial maps, historical maps, postcards, photographs, plans of buildings, copies of paintings, charts, survey results, diaries, artifacts, copies of newspapers and magazine articles, music tapes, travel brochures, recordings of interviews, computer databases, simulations and other computer software. Student-created social studies product samples are also on display.

How does a PYP social studies classroom work?

Inquiry-based units of study are the entry point into social studies learning. Each unit has a primary focus into one of the disciplines of social studies but inquiry will not be restricted only to that discipline. Students will experience what it is like to think and act like a historian, a geographer or a social scientist. Students and teachers identify together what they want to know, what they already know which might be relevant to the inquiry, what they need to know to answer their questions and how best they might find that out.

Students design interviews, interview, survey, take polls, read fiction and trade books, make timelines, devise and perform socio-dramas, make charts, complete decision-making trees and diagrams, create geographical and concept maps, interpret symbols and keys, measure distance, plot routes, examine artifacts, list sources, evaluate sources, work on computer databases and present patterns and trends.

The PYP teacher, as a knowledgeable member of the learning community, facilitates, structures and guides student inquiry; models the questioning approach; provides students with the time and ambiance to promote inquiry; and builds up a variety of diverse resources. The PYP teacher also ensures that learning materials reflect positive images of diverse groups and does not allow any one cultural or gender perspective to dominate.

Students engage in research, applying and acquiring a variety of thinking and learning skills; using multiple sources; looking at different points of view; applying historical, geographical and societal concepts, skills and attitudes to current issues and problems. Activities are selected which directly and most effectively answer the questions being researched. They allow for a variety of learning styles and language levels. Through these
activities students apply skills and concepts in new contexts as well as learn new skills and concepts in meaningful contexts.

As embryonic historians, geographers and social scientists, students learn to plan, collect, organize, interpret and present their findings by:

- formulating and asking questions about the past, about places and about society
- drawing information from, and responding to, stories about the past, from geographical and societal sources
- using and analysing evidence from a variety of historical, geographical and societal sources
- sequencing in chronological order
- orientating in relation to place
- identifying roles, rights and responsibilities in society
- assessing the accuracy, validity and possible bias of sources
- distinguishing between fact, opinion and fantasy
- interpreting evidence in order to speculate
- comparing and contrasting different sources
- empathizing with people
- organizing and communicating the results of their inquiries.

Students and teachers develop and define clear criteria with which their final presentation or product will be assessed.

**Why is a PYP social studies classroom the way it is?**

Students learn best when constructing meaning about questions which are significant and meaningful in their own lives, building on prior knowledge. An inquiry-based social studies programme enhances the likelihood that students will feel they belong to a community of learners. It helps them develop problem-solving skills and become decision makers. As a result, they will later be able to choose between and among political alternatives and make economic choices. They will be able to work in groups to solve local and global problems and make responsible choices about themselves, others and the environment.

In a world which is a complex mix of races, cultures, languages, religious affiliations and social class, students need to recognize that there is no one way of looking at events, situations, issues or problems. When their own school experiences allow them the right to hold positions which may differ from others and reflect that such positions are valid and valued, students will be able to seek and value other people’s points of view.

**How are social studies practices changing?** (See figure 29)

**How is social studies connected?**

The social world is influenced by science and technology. Scientific questions may need to be answered and scientific concepts understood, in the course of what is primarily a social studies inquiry.

Like social studies, the arts, including literature, are an exploration and illumination of life. These parts of the curriculum value the subjective and introspective as ways of knowing. Students can enhance their understanding of social studies through art, music, dance and reading literature.

Mathematics and language are both server disciplines to social studies. Social studies needs language to define its concepts and mathematics to quantify them. Students in language classes (whether ESL, host country, mother tongue or foreign) learn through appropriate social studies content.

How will we know what we have learned?
The learned curriculum

What is the PYP perspective on assessment?

Assessment is integral to all teaching and learning. It is central to the PYP goal of thoughtfully and effectively guiding students through the five essential elements of learning: the understanding of concepts, the acquisition of knowledge, the mastering of skills, the development of attitudes and the decision to take action.

Everyone concerned with assessment, including students, teachers, parents, administrators and board members, must have a clear understanding of the reason for the assessment, what is being assessed, the criteria for success and the method by which the assessment is made.

Both students and teachers should be actively engaged in assessing the students’ progress as part of the development of their wider critical thinking and self-evaluation skills. Teachers should also be concerned with evaluating the efficacy of the programme.

The PYP describes the taught curriculum as the written curriculum in action. Using the written curriculum, and in collaboration with colleagues and students, the teacher generates questions which guide structured inquiry in the classroom. Assessment focuses on the quality of student learning during the process of this inquiry and the quality of student learning which is evident in the products of this inquiry. Assessment is, therefore, integral to the taught curriculum. It is the means by which we analyse student learning and the effectiveness of our teaching and acts as a foundation on which to base our future planning and practice. It is central to our goal of guiding the student, from novice to expert, through the learning process.

What is assessment?

Assessment: is the gathering and analysing of information about student performance. It identifies what students know, understand, can do and feel at different stages in the learning process.

Formative assessment: is interwoven with the daily learning and helps teachers and students find out what the students already know in order to plan the next stage in learning. Formative assessment and teaching are directly linked: neither can function effectively or purposefully without the other.

Summative assessment: happens at the end of the teaching and learning process and gives the students opportunities to demonstrate what has been learned.

Evaluation: is the process of making a judgment about student progress or the effectiveness of a programme based on sufficient assessment information.
What are the purposes of assessment?

The purposes of assessment are to promote student learning, to provide information about student learning and to contribute to the evaluation of the effectiveness of the programme.

Student learning is promoted through:

- assessing the students’ prior knowledge and experience brought to the topic or task in order to plan and/or refine the teaching and learning programme or to meet individual or group needs
- building a profile of students’ understanding
- engaging students in reflection on their learning and in assessment of the work produced by themselves and by others.

Information about student learning is provided by:

- representative examples of students’ work or performance
- compiling statistics based on explicit benchmarks and rubrics
- records of test results.

Programme evaluation uses a variety of student assessments to:

- assess student performance in relation to the general and specific outcomes of the programme
- assess group performance in relation to other classes or groups both internally and externally
- inform others, including students, colleagues and parents.

What is good assessment practice?

Effective assessments:

- are planned for and built in, not bolted on
- identify what is worth knowing and assess it
- have criteria that are known and understood in advance
- allow students to demonstrate the range of their conceptual understandings, their knowledge and their skills
- are made up of tasks that require the synthesis and application of their learning
- focus on big ideas and transdisciplinary skills rather than facts or specialized skills
- are based on real-life experiences and can lead to other problems or questions
- focus on producing a quality product or performance
- highlight a student’s strength and expertise rather than what the student does not know
- include collaboration between the student and the teacher or among students
- employ many ways for a student to demonstrate expertise
- take into account different ways of learning and knowing and are sensitive to personal circumstances
- allow students to express different points of view and interpretation
- promote self-evaluation and peer-evaluation
- use scoring that focuses on the essence of the task and not on what is easiest to score
produce evidence that can be reported and understood by students, parents, teachers, administrators and board members

are continuous and cumulative
are subject to continuous review and improvement.

Assessment informs every stage of the learning and teaching process. In the earliest stages of curriculum planning, assessment requires the teacher to translate the purposes of the unit of inquiry into outcomes of the students’ learning. With these purposes and outcomes in mind, activities and resources are selected. Assessment of the students’ prior knowledge will help the teacher determine any necessary changes in purposes and outcomes of the students’ learning.

Continuous assessment provides insights into students’ understanding, knowledge, skills and attitudes. These are necessary to plan further activities which address issues of concern to the teacher and the students. Continuous assessment is also a means of exploring the learning styles and individual differences of the students in order to customize the unit of inquiry. Making modifications to the planning of inquiry in the light of feedback from assessment improves the overall programme.

**How do I develop assessments?**

In planning for assessment it is important to ask these questions:

- What is the function of the assessment?
- What broad purposes or objectives are being assessed?
- What specific purposes or objectives are being assessed?
- How can I collect evidence?
- What teaching approaches are being used to help the students be successful with the assessment?
- Which assessment activities fit into the flow of the classroom?
- Will the assessment task measure what is intended?
- Is the assessment activity reliable enough to allow sound conclusions to be drawn?
- How will the assessment activity be carried out?
- How will the assessment data be recorded?
- How will the assessment data be analysed?
- How and when will feedback be given?

After the assessment task is complete it is important to ask these further questions:

- Have the tasks provided ample information to allow a judgment to be made about whether the purposes or objectives have been met?
- What does the students’ performance reveal about their level of understanding?
- Have any unexpected results occurred?
- What changes should be made in the assessment procedure?
- How should the teaching and learning programme be modified as a result of the assessment?
How do I collect the data?

Observations: All students are observed often and regularly, with the teacher taking a focus varying from wide angle (for example focusing on the whole class) to close up (for example focusing on one student, or activity), and from non-participant (observing from without) to participant (observing from within).

Performance assessments: The assessment of goal-directed tasks with established criteria. They are meaningful and significant challenges and problems. In these tasks there are numerous approaches to the problem and rarely only one correct response. They are usually multi-modal and require the use of many skills. Audio, video and narrative records are often useful for this kind of assessment.

Process-focused assessments: All students are observed often and regularly and the observations are recorded by noting the typical as well as non-typical behaviours, collecting multiple observations to enhance reliability, and synthesizing evidence from different contexts to increase validity. A system of note taking and record keeping is created that minimizes writing and recording time. Checklists, inventories and narrative descriptions are common methods of collecting observations.

Selected responses: Single occasion, one-dimensional exercises. Tests and quizzes are the most familiar examples of this form of assessment.

Open-ended tasks: Situations in which students are presented with a stimulus and asked to communicate an original response. The answer might be a brief written answer, a drawing, a diagram or a solution. The work, with the assessment criteria attached, could be included in a portfolio.

Portfolios: A purposeful collection of a student’s work that is designed to demonstrate successes, growth, higher order thinking, creativity and reflection. Portfolios should not be thought of as a collection of work but rather as an exhibition of an active mind at work.

How do I evaluate these types of assessment?

Rubrics: An established set of criteria used for scoring or rating students’ tests, portfolios or performances. The descriptors tell the assessor what characteristics or signs to look for in students’ work and then how to rate that work on a predetermined scale. Rubrics can be developed by students as well as by teachers.

Benchmarks: Samples of students’ work that serve as concrete standards against which other samples are judged. Generally there is one benchmark for each achievement level in a scoring rubric.

Holistic scoring: This produces a single score, typically based on a four to six point scale. It is based on the overall impression of a sample of work, rated against established criteria.

Analytical scoring: This awards separate scores for different aspects of the work. This yields more information than holistic scoring and is often used for diagnostic purposes or when students need specific feedback on their strengths and weaknesses.
The preceding sections of this publication present an analysis of the various components of the PYP approach to curriculum. However, in order to understand fully the PYP it is important to see this approach as a synthesis of these components. This synthesis operates at several levels.

**A synthesis of the:**

| essential elements: | Teachers and students use powerful concepts to generate key questions with which to conduct inquiry into significant content. In the course of this inquiry students acquire essential knowledge and skills and engage in responsible action. They do so in a climate which fosters positive attitudes. In the course of planning and teaching, the essential elements are synthesized into key questions which drive inquiry, and into the learning outcomes which form the basis for assessment. |
| written, taught and learned curriculum: | Using the written curriculum as the primary resource, teachers and students plan a process of structured inquiry involving a range of classroom activities—the taught curriculum. Assessment, which provides data on the learned curriculum, is integral to these activities and focuses on both the quality of the learning process and that of the learning products. |
| separate disciplines into a coherent whole: | At the heart of the PYP curriculum are the essential elements: concepts, knowledge, skills, attitudes and actions. These elements transcend disciplinary barriers and forge the curriculum into a coherent whole. |
| school into an international community of learners: | The PYP sees students, parents and teachers as partners united by a spirit of inquiry and a commitment to continuous improvement, working towards the common goal of providing every student with an international education of the highest quality. |

The word “holistic” is much abused. Nonetheless, the PYP feels it is applicable in describing the PYP curriculum which presents the essential elements as a whole; the written, taught, and learned curriculum as a whole; the disciplines as aspects of a whole; and the school as a whole.

Finally, there is one greater whole in which the PYP firmly believes. The PYP is working towards the movement of our schools into a collaborative international community, in which each authorized school retains its identity and autonomy but shares its strengths and ideas with other authorized schools. The PYP welcomes the movement towards the creation of a system of international education which will better serve our students.

This publication represents the work of many teachers and administrators over an extended period. The PYP trusts that it provides one more piece of the picture, one more step towards creating the system of international education in which we so firmly believe.
Why inquiry?

The essential activity for keeping our paradigm current is persistent questioning. I will use the term inquiry. Inquiry is the engine of vitality and self-renewal.

Pascal, 1990

The PYP is committed to inquiry as the preferred approach to teaching and learning. However, this commitment to inquiry is not confined to classroom practices. The PYP believes that good schools are inquiry-based schools in which all members of the school’s community are continually reflecting on their practice in the context of a commitment to continuous personal, professional and institutional improvement. It further believes that:

- the approaches to learning it is advocating are relevant outside the classroom and will have an impact on the culture of the school
- without an understanding of this impact the curriculum cannot achieve its potential
- inquiry, as a means of learning, changing and improving is as valid for the school as a whole as it is for a group of students in the classroom.

The PYP supports the view, well documented in research, that:

- improvements in individual classrooms only take pace in the context of general school improvement
- the adults in a school must model the knowledge, skills, attitudes and actions they advocate for students
- effective schools, like effective classrooms, are places in which purposeful, open-ended inquiry is a feature of the culture
- inquiry enables individuals and groups to clarify their vision and to refocus on purpose
- effective schools make a commitment to continuous improvement
- effective schools develop the habit of collaboration while allowing space for people to be individuals, just as the PYP promotes collaboration within the community of PYP schools while allowing space for schools to reflect their own cultures.

Guidelines for Implementation

- Develop the habits of reflective practice, of questioning one’s own practice and the practices of the school.
- Encourage a climate of inquiry among staff, students, parents, board members.
- Structure the process of collaborative decision making as an open-ended inquiry.
- Use this process for the development of school policies and products.
What is my role?

*There’s pride and satisfaction in understanding your function better than anyone else and better than even you thought possible.*

Block, 1987

The degree of change required to implement the teaching and learning of the PYP at the school-wide level will depend on conditions in the school at the time of implementation. To be realistic, however, schools must recognize that:

- school-wide adoption of the PYP will require change not only in the classroom but throughout the school
- this change is likely to be slow, painful and beset with difficulties (these difficulties are always associated with any change which requires people to examine and modify their current practice)
- engaging in this change process will have a beneficial impact on the whole school and, most significantly, on the quality of student learning, but the struggle is worth it
- the process of change in teaching practice will require substantial, sustained support from the school for all teachers.

The role of the school’s administrators is crucial to the success of a change effort. Without the support of the school’s leadership this innovation will almost certainly fail. The PYP does not require that every administrator has to understand the finer points of the curriculum in every area but it is important to understand, and support, the basic principles which represent the essence of the PYP. Every administrator does need to be aware, also, of the kinds of practical support needed for successful implementation.

**Guidelines for implementation**

- Develop a clear plan with a timeline for implementation.
- Identify and empower curriculum leaders; send them to PYP workshops.
- Provide resources for PYP workshop leaders to address the staff.
- Arrange general sessions about the PYP for all staff.
- Form PYP working groups within the school.
- Model inquiry yourself during meetings or workshops.
- Rearrange the schedule to allow shared planning time.
- Set aside inservice days to work with the PYP curriculum.
- Run a weekend retreat to discuss the PYP curriculum and plan units of inquiry.
- Write articles yourself or encourage others; write a PYP newsletter for the staff.
- Ensure that all PYP publications are removed from your desk and put into the right hands.
- Create a topic bank for storing planners.
- Make sure that the purchase of resources is driven by the curriculum.
What do I tell the board?

*Making one’s position clear to the governors is ideally an interactive process. The emphasis should be on the head taking charge. The head, in effect, is saying to the government that instructional leadership is his or her number one priority.*

Fullan, 1992

The board must be kept informed about the school’s involvement in implementing a new curriculum.

**Guidelines for implementation**

*Let the board know that the PYP curriculum:*

- is developed by a wide variety of schools (international, national, fee-paying, state-funded); no single national curriculum is being imposed
- develops attitudes and actions alongside the more academic curriculum areas
- includes an emphasis on community service
- provides opportunities to include parents in the learning process
- aims to produce students who will make a difference in a complex, challenging future
- works towards the achievement of student learning outcomes
- is cheaper and more effective than going it alone
- gives the school access to extensive expertise
- facilitates transfer between schools
- develops the conceptual understanding, knowledge, skills and attitudes needed for tomorrow’s workplace.
What do I tell the parents?

*There is clear evidence from home-school projects that children make better progress when their parents are involved in their education.*

Bell, 1990

Experience in a number of schools has shown that, given the right approach, parents are relieved to hear about the PYP and are very supportive of it. Our schools often form a focus for the families we serve. We are accountable to them and their children for the education we offer.

Guidelines for implementation

Let parents know that:

- the PYP provides a shared curriculum for primary schools
- the PYP is working to define a balanced programme of concepts, knowledge, skills, attitudes and actions for children
- through the international profile of student achievement, the PYP will help to facilitate transfer between schools
- the PYP is part of the continuum of international education offered by the International Baccalaureate Organisation (the approach to teaching and learning in the PYP is good preparation for the IBO’s Middle Years Programme and the IBO’s Diploma Programme)
- the PYP curriculum sets high standards for and has high expectations of the students
- the teachers plan the programme together, providing a more coherent education
- the PYP promotes good teaching practice, both through the written curriculum documents and by sharing ideas among authorized schools
- the PYP curriculum incorporates a range of assessment, recording and reporting strategies, so that parents will receive clear information on their children’s progress.

Ways to inform parents

- Provide information about the PYP in parent newsletters.
- Share and display examples of students’ work, together with PYP planners.
- Hold parents evenings on the subject of international curriculum.
- Consider modelling PYP teaching principles.
- Distribute the guide for parents, customized for your school’s setting.
Understanding the Primary Years Programme

A Guide for Parents

How is the curriculum developed?

The PYP holds regular meetings to which authorized schools send representatives. These representatives serve on curriculum committees which develop the curriculum for individual disciplines, in the context of a coherent, central framework. The work of these committees is coordinated by a steering committee. Since the early stages of its development the PYP has also worked closely with consultants and teacher trainers from different national systems.

What will my child be learning?

The PYP has designed a transdisciplinary curriculum which draws the individual disciplines together into a coherent whole, while preserving the essence of each subject.

Your child will:

- develop a deep understanding of important concepts
- conduct research into knowledge which has local and global significance
- acquire and practise a range of essential skills
- be encouraged to develop positive attitudes towards learning, the environment and other people
- have the opportunity for involvement in responsible action and social service.

How will I know how my child is doing?

The PYP promotes the use of a range of assessment strategies which are designed to give a clear picture of your child’s progress. This progress will be reported to you regularly, both orally and in writing. You are encouraged to play an active role in supporting your child’s learning.

How can I support my child’s learning?

The PYP sees learning as a partnership between student, parent and school. The degree of parental involvement may vary from school to school but the fundamentals of parental support remain the same.

You can help your child by:

- maintaining regular contact with the school
- sharing books with your child
- supporting your child’s mother tongue
- assisting your child with research projects
- attending curriculum information sessions at school and parent/teacher conferences
- providing an appropriate setting and structured routine for doing homework.
After the PYP, what next?

The IBO sees the PYP curriculum as an excellent preparation, but not a prerequisite, for the IBO’s Middle Years Programme (MYP) for 11 to 16 year olds. Both curriculums place a focus on critical thinking, personal responsibility for learning, student inquiry and social service. Similarly the MYP is seen as an ideal foundation, but again not a prerequisite, for the IBO’s Diploma Programme for 16 to 19 year olds. The IBO’s Diploma Programme is regarded by many as the finest pre-university curriculum available.

Will the PYP help my child fit into another school?

Although no school or curriculum can guarantee a perfect fit when children transfer to a new school, particularly a school in a different country, parents may be reassured by the following points.

Transfer to schools following a national curriculum

- Close attention is paid to a range of national curriculums when developing the PYP curriculum.
- Students transferring from international schools usually have no trouble with the standards of national schools.

Transfer to other schools offering the PYP

- Students in other schools implementing the PYP curriculum will have common learning experiences in terms of conceptual development, skill acquisition, positive attitudes and meaningful action. There will be less uniformity of specific content in certain areas, since schools will naturally wish to reflect the unique nature of their own locations.
- The PYP is working towards agreement on a common set of assessment, recording and reporting strategies which will facilitate the transfer of students.

What shall I do if I still have questions?

Professional educators can sometimes inadvertently explain curriculum issues in ways which are not clear to parents. While we see parents as our partners in the learning process, we recognize that parents are also our clients. You have an obvious right to know about the educational programme in which your child is engaged. If you have any further questions, please ask—you will find your school only too willing to discuss the PYP curriculum with you.
How can I provide professional development?

There is simply not enough opportunity and not enough encouragement for teachers to work together, learn from each other, and improve their expertise as a community.

Fullan and Hargreaves, 1992

The PYP is more than a series of written documents. It is a way of thinking, an approach to teaching and learning, which for some teachers represents a paradigm shift. In order to accommodate this change people need time and support. Some means of providing this support are offered below.

Guidelines for implementation

- Ascertain where teachers are in relation to the change; let them tell you what support they need.
- Use data gathered from the professional appraisal process to inform discussions with teachers.
- Recognize that inservice training can take place within individual schools, with members of staff providing their own inservice training. Individual teachers can share successful lessons and give support to less confident staff by team teaching.
- Send staff to PYP workshops or summer programmes.
- Invite one of the approved PYP trainers into your school.
- Share, with other PYP schools, successful planners, unit banks, videos and books, examples of good PYP practice and expertise, with visits being made to schools which have a reputation for good teaching. Communication and sharing of ideas have been simplified and schools can make use of email and the Internet.
- Provide time when teachers can plan and reflect together. This is the single most effective and lasting form of professional development.
Where will we find the time?

Time, or more properly lack of it, is one of the most difficult problems faced by schools and districts engaged in restructuring.

Watts and Castle, 1993

As any administrator or teacher will confirm, there is never enough time. Set out below are some practical suggestions for finding, making or buying that precious commodity, time.

Guidelines for implementation

Release time

- Release teachers during assemblies.
- Teach a class yourself to enable a teacher to work with a colleague.
- Encourage team-teaching, which may allow one teacher to take a larger group, so releasing a colleague.
- Schedule early release or late start days so that teams can plan together; build these into the calendar or weekly schedule.
- Use college interns, teamed with a qualified teacher, to work with combined classes.
- Design shared units involving teachers, parents and students.
- When planning themes, share the work; let each person prepare one aspect for everybody.

Rescheduled time

- Make sure that the schedule allows for common planning time between members of a grade level team; for example, add minutes on four days, and release students early on the fifth, or start the day later for students, and earlier for teachers.

Better use of time

- Many schools have an orientation week or days at the beginning of a school year. Keep administrative details to a minimum and use the time for planning together.
- View each staff meeting as a professional development opportunity. Handle administrative issues in other ways—memos, daily bulletins, a read-and-pass-on file.
- Reconsider how best to use inservice days. Recognize that the one-off consultant is not always effective in bringing about lasting change and that training days may be better used simply by providing time for teachers to plan together.

Purchased time

- Use more of the budget to release teachers to plan and reflect together; for example, pay substitutes or pay staff for part of their own time.
- Take the whole staff on a weekend retreat away from school and spend the time discussing, planning and reflecting.
How can I make sure it is happening?

While implementing new curriculum is a multi-faceted and gradual process, it does involve some definite steps which should be part of the plan of any principal wishing to enhance the quality of education in his or her school.

Hewitt, 1988

To ensure that using PYP materials has a real impact in classrooms, it is essential to guide the process.

Guidelines for implementation

- Make sure that the PYP planners are used.
- Develop the library/media centre collection around units of inquiry, so that teachers have the resources they need.
- Visit classrooms to see inquiry in action.

Most significantly:

- evaluate what you value: since we value risk taking, critical thinking and the use of a range of teaching and assessment strategies, make them the focus of any job description, professional appraisal or teacher evaluation system, and professional development programme.

The logic of this approach to professional appraisal and development is:

- the school’s philosophy should clearly express a set of beliefs and values about student learning
- these beliefs and values can be well expressed through the PYP student profile which serves to drive the curriculum
- these outcomes must be the major shaping force for classroom practice, the taught curriculum
- if these outcomes are to shape practice then they must shape the description of that practice.

The PYP has therefore designed a job description which is a direct reflection of the practices described in this volume.

The job description:

- focuses solely on activities relating to student learning (as other professional duties would be described in a staff working agreement/staff handbook/contract)
- encompasses practices which represent observable activities (the job description forms the basis for a system of professional appraisal or teacher evaluation)
- enables the professional appraisal system to form the basis for a programme of professional development
- enables professional development to be linked, through a series of logical steps, to the school’s beliefs and values about student learning, as shown on page 102.

Figure 30  Linking philosophy to professional development

PYP teacher’s job description

Our school’s beliefs and values are contained in the school’s statement of philosophy. The philosophy commits us all to certain learning outcomes for students and, therefore, to the types of teaching which will produce these outcomes.

The fundamental responsibility of every teacher is to embrace the values and beliefs expressed in the philosophy of the PYP and to work constantly to translate them into daily classroom practice. The school’s primary purpose is student learning and the job description is therefore structured according to the PYP’s three central questions relating to this learning.

However, in an international community of learners such as ours, everyone is a learner. In recognition of this, we have added a final question which focuses on our responsibility for our own learning, and links the job description to the systems of professional appraisal and development.

What do we want to learn?
Planning

The teacher is accountable for:

- planning collaboratively for student learning
- planning, based on agreed student learning outcomes and in the context of a coherent, school-wide programme
- involving students in planning for their own learning and assessment
planning which builds on students’ previous knowledge and experience
planning significant units of inquiry, to be explored in depth
addressing assessment issues throughout the planning process
planning which emphasizes connections between curriculum areas
planning which accommodates a range of ability levels.

How best will we learn?
Teaching
The teacher is accountable for:

- using a range and balance of teaching strategies
- grouping strategies using a variety of different learning situations
- viewing students as thinkers with their own emerging theories
- building on what students know
- using a variety of resources representing multiple perspectives
- empowering students to feel responsible and to take action
- involving students actively in their own learning
- pursuing open-ended inquiry and real-life investigations
- maintaining constant awareness of the needs of second language learners
- addressing the needs of students with different levels and types of ability.

How will we know what we have learned?
Assessing
The teacher is accountable for:

- viewing planning, teaching and assessing as interconnected processes
- using a range and balance of assessment strategies
- using a range and balance of recording and reporting strategies
- involving students, parents and colleagues in the assessment process
- involving students in shared reflection during and at the end of each unit
- evaluating the programme collaboratively using agreed flexible systems
- enabling students to see assessment as a means of describing their learning
- assessing the level of students’ current experience and understanding before embarking on new learning.

How can we continue to learn?
Professional appraisal and development
The teacher is accountable for:

- active participation in constructive professional appraisal based directly on the points in the job description, therefore continually working to improve learning for students
- actively seeking professional development in any of the above points which are considered by the teacher and/or the school to require development.
**How can I be sure that the students are really learning?**

*We value what we assess. It is time we began assessing what we value.*  
**Wiggins 1989**

The PYP approach to learning demands that a range of assessment, recording and reporting strategies be used. These strategies will provide the school’s leadership, staff, students and parents with accurate and accessible data on student learning. A school leader needs to understand the purposes and principles of assessment and provide leadership in the development and implementation of assessment policies.

**Guidelines for implementation**

- Learn as much as possible about the principles, purposes and practice of effective assessment.
- Reinforce the links between assessment, recording and reporting.
- Review the school’s systems of reporting to ensure that they reflect the curriculum.
- Ensure that teachers understand their role in the assessment process, describe this role in the job description and include it in the appraisal process.
- Develop a comprehensive assessment handbook which incorporates philosophy, purpose, principles, practice and policies.
- See “How will we know what we have learned? The learned curriculum”, page 87, for further details on assessment.
Acknowledgments

This curriculum guide is the product of many hours of collaboration on the part of the members of the previous International Schools Curriculum Project (ISCP) and the International Baccalaureate Organisation (IBO).

The IBO wishes to thank the members, both schools and individuals, of the ISCP for their commitment to the development of the Primary Years Programme. In particular, the IBO would like to thank the members of the ISCP curriculum working groups and the ISCP steering committee for the time, energy, enthusiasm and vision they have brought to the programme.
